Received 11 July 2009; accepted 12 July 2009

Key indicators: single-crystal X-ray study;  $T = 223\text{ K}$ ; mean  $\sigma(\text{C}-\text{C}) = 0.003\text{ \AA}$ ;  $R$  factor = 0.050;  $wR$  factor = 0.133; data-to-parameter ratio = 13.9.

In the title molecule,  $C_{11}H_{14}N_2O_3$ , the acetohydrazide group is planar 0.084 (1)  $\text{\AA}$  and forms a dihedral angle of 19.7 (1) $^\circ$  with the benzene ring. One of the methoxy groups is coplanar with the attached benzene ring within 0.052 (3)  $\text{\AA}$ , whereas the other is slightly twisted [ $\text{C}-\text{O}-\text{C}-\text{C} = 6.3(3)^\circ$ ]. The molecule adopts a *trans* configuration with respect to the  $\text{C}\equiv\text{N}$  bond. In the crystal, the molecules are linked into chains along the  $a$  axis by  $\text{N}-\text{H}\cdots\text{O}$  hydrogen bonds and the chains are cross-linked into a three-dimensional network by  $\text{C}-\text{H}\cdots\text{O}$  hydrogen bonds.

### Comment

Schiff bases have attracted much attention due to the possibility of their analytical applications (Cimerman *et al.*, 1997). They are also important ligands, which have been reported to have mild bacteriostatic activity and are used as potential oral iron-chelating drugs for genetic disorders such as thalassemia (Offe *et al.*, 1952; Richardson *et al.*, 1988). Metal complexes based on Schiff bases have received considerable attention because they can be utilized as model compounds of active centres in various complexes (Tamboura *et al.*, 2009). We report here the crystal structure of the title compound (Fig. 1).

The acetohydrazide group is planar and it forms a dihedral angle of 19.7 (1) $^{\circ}$  with the benzene ring. One of the methoxy groups is coplanar with the attached benzene ring [C1—O1—C4—C5 = -1.7 (3) $^{\circ}$ ] whereas the other is slightly twisted [C2—O2—C3—C8 = 6.3 (3) $^{\circ}$ ]. The molecule adopts a *trans* configuration with respect to the C=N bond. Bond lengths and angles are comparable to those observed for N'-[1-(4-methoxyphenyl)ethylidene]acetohydrazide (Li *et al.*, 2008).

The molecules are linked into a chain along the *a* axis by N—H $\cdots$ O hydrogen bonds (Table 1). The chains are cross-linked into a three-dimensional network by C—H $\cdots$ O hydrogen bonds (Fig. 2).

### Experimental

3,4-Dimethoxybenzaldehyde (1.66 g, 0.01 mol) and acetohydrazide (0.74 g, 0.01 mol) were dissolved in stirred methanol (25 ml) and left for 2.5 h at room temperature. The resulting solid was filtered off and recrystallized from ethanol to give the title compound in 90% yield. Single crystals suitable for X-ray analysis were obtained by slow evaporation of an ethanol solution at room temperature (m.p. 470–472 K).

### Refinement

H atoms were positioned geometrically (N—H = 0.86 Å and C—H = 0.93 or 0.96 Å) and refined using a riding model, with  $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C}, \text{N})$  and  $1.5U_{\text{eq}}(\text{C}_{\text{methyl}})$ . A rotating group model was used for the methyl groups.

### Figures

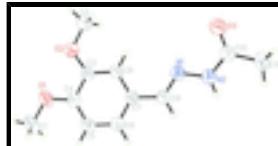

Fig. 1. The molecular structure of the title compound. Displacement ellipsoids are drawn at the 40% probability level.

$Z = 8$	$0.24 \times 0.21 \times 0.20 \text{ mm}$

### Data collection

Bruker SMART CCD area-detector diffractometer	2070 independent reflections
Radiation source: fine-focus sealed tube	1819 reflections with $I > 2\sigma(I)$
Monochromator: graphite	$R_{\text{int}} = 0.034$
$T = 223 \text{ K}$	$\theta_{\text{max}} = 25.0^\circ$
$\varphi$ and $\omega$ scans	$\theta_{\text{min}} = 1.7^\circ$
Absorption correction: multi-scan (SADABS; Bruker, 2002)	$h = -10 \rightarrow 10$
$T_{\text{min}} = 0.977$ , $T_{\text{max}} = 0.979$	$k = -12 \rightarrow 12$
11332 measured reflections	$l = -27 \rightarrow 28$

### Refinement

Refinement on $F^2$	Hydrogen site location: inferred from neighbouring sites
Least-squares matrix: full	H-atom parameters constrained
$R[F^2 > 2\sigma(F^2)] = 0.050$	$w = 1/[\sigma^2(F_o^2) + (0.0593P)^2 + 0.6946P]$
$wR(F^2) = 0.133$	where $P = (F_o^2 + 2F_c^2)/3$
$S = 1.10$	$(\Delta/\sigma)_{\text{max}} = 0.001$
2070 reflections	$\Delta\rho_{\text{max}} = 0.15 \text{ e \AA}^{-3}$
	$\Delta\rho_{\text{min}} = -0.12 \text{ e \AA}^{-3}$

149 parameters  
 Extinction correction: SHELXL97 (Sheldrick, 2008),  
 $F_c^* = k F_c [1 + 0.001 x F_c^2 \lambda^3 / \sin(2\theta)]^{1/4}$

Primary atom site location: structure-invariant direct methods  
 Extinction coefficient: 0.0113 (16)

Secondary atom site location: difference Fourier map

### *Special details*

**Geometry.** All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted R-factor wR and goodness of fit S are based on  $F^2$ , conventional R-factors R are based on F, with F set to zero for negative  $F^2$ . The threshold expression of  $F^2 > 2\text{sigma}(F^2)$  is used only for calculating R-factors(gt) etc. and is not relevant to the choice of reflections for refinement. R-factors based on  $F^2$  are statistically about twice as large as those based on F, and R- factors based on ALL data will be even larger.
