Correspondence e-mail: zgdhxc@126.com

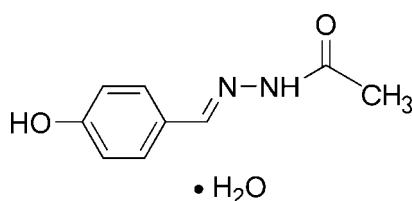

Received 7 July 2009; accepted 22 July 2009

Key indicators: single-crystal X-ray study;  $T = 223\text{ K}$ ; mean  $\sigma(\text{C}-\text{C}) = 0.002\text{ \AA}$ ; disorder in main residue;  $R$  factor = 0.037;  $wR$  factor = 0.100; data-to-parameter ratio = 12.0.

In the title compound,  $\text{C}_9\text{H}_{10}\text{N}_2\text{O}_2\cdot\text{H}_2\text{O}$ , the molecular skeleton of the acetohydrazide molecule is nearly planar [within  $0.014(1)\text{ \AA}$ ]. The molecule adopts a *trans* configuration with respect to the  $\text{C}=\text{N}$  bond, while the side chain is slightly twisted away from the attached ring, forming a dihedral angle of  $9.975(8)^\circ$ . The crystal packing exhibits a three-dimensional network composed from alternating acetohydrazide molecules and uncoordinated water molecules, which interact via  $\text{N}-\text{H}\cdots\text{O}$ ,  $\text{O}-\text{H}\cdots\text{O}$  and  $\text{O}-\text{H}\cdots\text{N}$  hydrogen bonds. A  $\text{C}-\text{H}\cdots\pi$  interaction is also present.

#### **Comment**

Schiff bases have attracted much attention due to their possibility of analytical application (Ciemerman *et al.*, 1997). They are also important ligands, which have been reported to have mild bacteriostatic activity and potential oral iron-chelating drugs for genetic disorders such as thalassemia (Offe *et al.*, 1952, Richardson *et al.*, 1988). Metal complexes based on Schiff bases have received considerable attention because they can be utilized as model compounds of active centres in various complexes (Tamboura *et al.*, 2009). We report here the crystal structure of the title compound (Fig. 1).

In the title compound,  $C_9H_{10}N_2O_2 \cdot H_2O$ , (I) the molecular skeleton is nearly planar. The molecule adopts a trans configuration with respect to the C=N bond, while the side chain is slightly twisted away from the attached ring. The dihedral angle between these two essentially planar units is  $9.975(8)^\circ$ . Bond lengths and angles are comparable to those observed for *N'*-[1-(4-methoxyphenyl)ethylidene]acetohydrazide (Li *et al.*, 2008).

The crystal packing exhibits a three-dimensional network composed from alternating molecules of (I) and crystalline water, which interact via N-H $\cdots$ O, O-H $\cdots$ O and O-H $\cdots$ N hydrogen bonds. In addition, a intermolecular C—H $\cdots$  $\pi$  interactions is observed (Table 1 and Fig 2).

#### **Experimental**

4-Hydroxybenzaldehyde (1.22 g, 0.01 mol) and acetohydrazide (0.74 g, 0.01 mol) were dissolved in stirred methanol (20 ml) and left for 2.5 h at room temperature. The resulting solid was filtered off and recrystallized from ethanol to give the title compound in 95% yield. Single crystals suitable for X-ray analysis were obtained by slow evaporation of an ethanol solution at room temperature (m.p. 435–437 K).

#### **Refinement**

H atoms of the water molecule were located in a difference map and were refined with O-H distances restrained to 0.84 (2) Å and 0.88 (2) Å. Other H atoms were positioned geometrically (N-H = 0.86 Å, O-H=0.82 Å and C-H = 0.93 or 0.96 Å) and refined using a riding model, with  $U_{\text{iso}}(\text{H})=1.2U_{\text{eq}}(\text{C},\text{N})$  and  $1.5U_{\text{eq}}(\text{C}_{\text{methyl}})$ . In the absence of significant anomalous scattering effects, Friedel pairs were averaged.

### Data collection

Bruker SMART CCD area-detector diffractometer	1764 independent reflections
Radiation source: fine-focus sealed tube	1569 reflections with $I > 2\sigma(I)$
Monochromator: graphite	$R_{\text{int}} = 0.015$
$T = 223 \text{ K}$	$\theta_{\text{max}} = 25.0^\circ$
$\varphi$ and $\omega$ scans	$\theta_{\text{min}} = 2.6^\circ$
Absorption correction: multi-scan (SADABS; Bruker, 2002)	$h = -9 \rightarrow 9$

$T_{\min} = 0.969$ ,  $T_{\max} = 0.976$   
4820 measured reflections

$k = -10 \rightarrow 12$   
 $l = -14 \rightarrow 14$

### Refinement

Refinement on $F^2$	Secondary atom site location: difference Fourier map
Least-squares matrix: full	Hydrogen site location: inferred from neighbouring sites
$R[F^2 > 2\sigma(F^2)] = 0.037$	H atoms treated by a mixture of independent and constrained refinement
$wR(F^2) = 0.100$	$w = 1/[\sigma^2(F_o^2) + (0.0527P)^2 + 0.2585P]$ where $P = (F_o^2 + 2F_c^2)/3$
$S = 1.06$	$(\Delta/\sigma)_{\max} < 0.001$
1764 reflections	$\Delta\rho_{\max} = 0.18 \text{ e } \text{\AA}^{-3}$
147 parameters	$\Delta\rho_{\min} = -0.22 \text{ e } \text{\AA}^{-3}$
Primary atom site location: structure-invariant direct methods	Extinction correction: none

### Special details

**Geometry.** All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted R-factor wR and goodness of fit S are based on  $F^2$ , conventional R-factors R are based on F, with F set to zero for negative  $F^2$ . The threshold expression of  $F^2 > 2\text{sigma}(F^2)$  is used only for calculating R-factors(gt) etc. and is not relevant to the choice of reflections for refinement. R-factors based on  $F^2$  are statistically about twice as large as those based on F, and R- factors based on ALL data will be even larger.
