Received 22 July 2009; accepted 28 July 2009

Key indicators: single-crystal X-ray study; $T = 173\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.002\text{ \AA}$; R factor = 0.031; wR factor = 0.089; data-to-parameter ratio = 17.7.

The dihedral angle between the triazole ring and the thiazole ring in the title compound, $\text{C}_9\text{H}_{13}\text{N}_5\text{S}$, is $64.35(7)^\circ$. The crystal structure is stabilized by intermolecular $\text{N}-\text{H}\cdots\text{N}$ hydrogen bonds, which link the molecules into a two-dimensional network.

4-*tert*-Butyl-5-(1*H*-1,2,4-triazol-1-yl)thiazol-2-amine

A.-Y. Xie, J. Ye, Z. Qin and A.-X. Hu

Comment

Thiazole derivatives and 1,2,4-triazole derivatives have been found to be active compounds with diversely biological activities (Zhou *et al.*, 2007; Shao *et al.*, 2008). We herein report the synthesis and structures of the title compound, 4-*tert*-butyl-5-(1*H*-1,2,4-triazol-1-yl)thiazol-2-amine, which was incorporated 1*H*-1,2,4-triazole units into the novel thialoyl urea compounds in order to find novel leading compounds with potential anticancer activities.

The title compound (Fig. 1), contains two planar subunits: the thiazole ring and the triazole ring. The dihedral angles between them is 64.35 (7). The crystal structure (Fig. 2) is stabilized by intermolecular hydrogen bonds between the amino group and the nitrogen atoms of the thiazol ring and the triazole ring of the neighbouring molecules.

For related structures, see: Zhou *et al.* (2007), Shao *et al.* (2008).

Experimental

1-bromo-3,3-dimethyl-1-(1*H*-1,2,4-triazol-1-yl)butan-2-one (0.01 mol) were refluxed with thiourea (0.01 mol) in ethanol (45 ml) for 1.5 h (monitored by TLC). Then the pH of the mixture was adjusted to 9 with ammonia and filtered to obtain white solid, 4-*tert*-butyl-5-(1*H*-1,2,4-triazol-1-yl) thiazol-2-amine. Yield 85.5%, m.p. 451 K.

Crystals suitable for X-ray structure determination were obtained by slow evaporation of an ethanol solution at room temperature.

Refinement

The H-atoms were positioned geometrically, with C—H = 0.98 Å for methyl, C—H = 0.95 Å for the triazole ring, C—H = 0.88 Å for the amino group and refined as riding with $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C,N})$ or $1.5U_{\text{eq}}(\text{C,methyl})$.

Figures

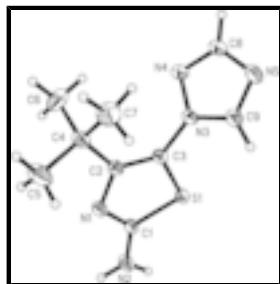

Fig. 1. Molecular structure showing 50% probability displacement ellipsoids.

supplementary materials

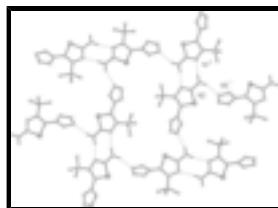

Fig. 2. A packing diagram for the title compound showing intermolecular hydrogen bonds as dashed lines. H atoms bonded to C omitted for clarity.

Special details

Experimental. ^1H NMR (CDCl_3 , 400 MHz) δ : 1.11 (s, 9H, $(\text{CH}_3)_3$), 4.38 (s, 2H, NH_2), 8.06 (s, 1H, $\text{C}_2\text{H}_2\text{N}_3$ 3-H), 8.23 (s, 1H, $\text{C}_2\text{H}_2\text{N}_3$ 5-H).

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
