Received 2 July 2009; accepted 3 August 2009

Key indicators: single-crystal X-ray study;  $T = 200\text{ K}$ ; mean  $\sigma(\text{C}-\text{C}) = 0.002\text{ \AA}$ ;  
 $R$  factor = 0.049;  $wR$  factor = 0.131; data-to-parameter ratio = 16.3.

The title compound,  $C_{17}H_{19}\text{NO}$ , crystallized with two molecules per asymmetric unit.  $\text{C}-\text{H}\cdots\text{O}$  hydrogen bonds lead to infinite chains along [100]. According to graph-set theory, the descriptor  $C_1^1(13)C_1^1(13)$  can be assigned.

## 4-[4-(Dimethylamino)benzylidene]-2,6-dimethylcyclohexa-2,5-dienone

N. Hampel, D. Richter, A. R. Ofial, H. Mayr and P. Mayer

### Comment

The asymmetric unit of (I) contains two complete molecules of the title compound. Figure 1 shows one of the two independent molecules.

A major difference between the two symmetrically independent molecules is found in the angle formed by the planes of the two C<sub>6</sub>-rings within a molecule. This angle is found to be 35.19 (7)<sup>o</sup> between the planes in one molecule but only 20.00 (7)<sup>o</sup> between the planes in the other molecule (Fig. 2). With a bulky naphthyl substituent at the C atom linking the two rings, an angle of 43.16 (6)<sup>o</sup> is observed [Kawai *et al.* (2004)].

The molecular packing, which is shown in Figure 3, is dominated by two C—H···O hydrogen bonds leading to infinite chains along [100]. Each of the chains is built up by 13 atoms and contains one donor atom and one acceptor atom. According to graph set theory [Bernstein *et al.* (1995), Etter *et al.* (1990)] the descriptor C<sub>1</sub><sup>1</sup>(13)C<sub>1</sub><sup>1</sup>(13) can be assigned. The strands are cross-linked by very weak C—H···C contacts with H···C distances of at least 2.79 Å (Table 1).

### Experimental

The title compound was prepared under an atmosphere of dry N<sub>2</sub> from (4-hydroxy-3,5-dimethylphenyl)[4-(dimethylamino)phenyl]methanol [Richter *et al.* (2009)] (200 mg, 0.737 mmol) that was dissolved in dry CH<sub>2</sub>Cl<sub>2</sub> (60 ml) and cooled to 0 °C. Then ethereal HBF<sub>4</sub>-solution (0.110 ml, 0.811 mmol) was added at 0 °C. After 5 min, NEt<sub>3</sub> (0.133 ml, 0.958 mmol) was added. The cooling bath was removed and stirring was continued for 3 h before the mixture was washed with water (3 times). The organic layer was dried (MgSO<sub>4</sub>) and the solvent was removed under reduced pressure. Crystals were obtained by slow cooling of a warm solution of the title compound in acetonitrile. Yield: 149 mg (80%), mp 127–128 °C.

### Refinement

The H atoms were positioned geometrically (C—H = 0.98 Å for CH<sub>3</sub>, 0.95 Å for CH) and treated as riding on their parent atoms [ $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C})$  for CH,  $U_{\text{iso}}(\text{H}) = 1.5U_{\text{eq}}(\text{C})$  for CH<sub>3</sub>].

### Figures

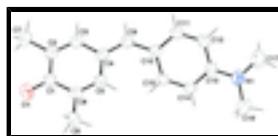

Fig. 1. The molecular structure of the title compound (one molecule out of two of the asymmetric unit), with atom labels and anisotropic displacement ellipsoids (drawn at 50% probability level) for non-H atoms.

## supplementary materials

---

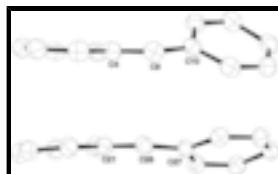

Fig. 2. Schematic representation of the different orientations of the aromatic planes in the two molecules, viewed along the C—H bond of the linking group and parallel to the dienone ring planes. For clarity all atoms connected to the aromatic rings have been omitted.

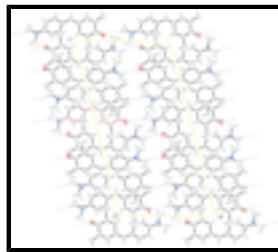

Fig. 3. The packing of the title compound, viewed along [010]. Dashed lines indicate hydrogen bonds of the type C—H···O. The solid, red bonds link the 13 atoms involved in one of the two different hydrogen bonds leading to chains along [100].

#### Refinement

Refinement on $F^2$	Secondary atom site location: difference Fourier map
Least-squares matrix: full	Hydrogen site location: inferred from neighbouring sites
$R[F^2 > 2\sigma(F^2)] = 0.049$	H-atom parameters constrained

$wR(F^2) = 0.131$   
 $w = 1/[\sigma^2(F_o^2) + (0.058P)^2 + 0.2713P]$   
 $S = 1.02$   
 $(\Delta/\sigma)_{\max} = 0.001$   
 5725 reflections      where  $P = (F_o^2 + 2F_c^2)/3$   
 $\Delta\rho_{\max} = 0.14 \text{ e } \text{\AA}^{-3}$   
 351 parameters       $\Delta\rho_{\min} = -0.18 \text{ e } \text{\AA}^{-3}$   
 Primary atom site location: structure-invariant direct  
 methods      Extinction correction: none

### Special details

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > 2\sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on all data will be even larger.
