Correspondence e-mail: gowdabt@yahoo.com

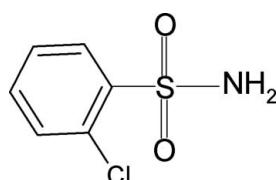

Received 8 August 2009; accepted 10 August 2009

Key indicators: single-crystal X-ray study;  $T = 299$  K; mean  $\sigma(\text{C}-\text{C}) = 0.005 \text{ \AA}$ ;  $R$  factor = 0.022;  $wR$  factor = 0.060; data-to-parameter ratio = 9.7.

In the crystal of the title compound,  $\text{C}_6\text{H}_6\text{ClNO}_2\text{S}$ , N—H···O hydrogen bonds pack the molecules into sheets parallel to the  $ac$  plane.

## 2-Chlorobenzenesulfonamide

B. T. Gowda, S. Foro, K. Shakuntala and H. Fuess

### Comment

The chemistry of sulfonamides is of interest as they show distinct physical, chemical and biological properties. Many aryl-sulfonamides and their N-halo compounds exhibit pharmacological, fungicidal and herbicidal activities due to their oxidizing action in aqueous, partial aqueous and non-aqueous media. In the present work, the structure of 2-chlorobenzenesulfonamide has been determined to explore the substituent effects on the solid state structures of sulfonamides and N-halo arylsulfonamides (Gowda *et al.*, 2003; Gowda, Babitha *et al.* 2007; Gowda, Nayak *et al.* 2007; Gowda, Srilatha *et al.* 2007). The structure of the title compound (Fig. 1) closely resembles those of the parent benzenesulfonamide (Gowda, Nayak *et al.*, 2007) and other aryl sulfonamides (Gowda, Babitha *et al.*, 2007; Gowda, Srilatha *et al.*, 2007; Jones & Weinkauf, 1993; Kumar *et al.*, 1992; O'Connor & Maslen, 1965). The title compound crystallizes in monoclinic space group Cc in contrast to the monoclinic *Pc* space group observed with the parent sulfonamide (Gowda *et al.*, 2007*b*) and orthorhombic Pbca space group with 4-fluorobenzenesulfonamide (Jones & Weinkauf, 1993) and 4-aminobenzenesulfonamide (O'Connor & Maslen, 1965) and monoclinic P2<sub>1</sub>/n space group with 4-chlorobenzenesulfonamide and 4-bromobenzenesulfonamide (Gowda *et al.*, 2003), and 4-methylbenzenesulfonamide (Kumar *et al.*, 1992). The molecules in the title compound are packed into infinite 3-D molecular network through N1—H11···O1 and N1—H12···O2 hydrogen bonding (Table 1 & Fig.2).

### Experimental

The purity of the commercial sample (TCI, Tokyo) was checked and characterized by its infrared spectra. The single crystals used in X-ray diffraction studies were grown in ethanol solution by a slow evaporation of the solvent at room temperature.

### Refinement

The H atoms of the NH<sub>2</sub> group were located in difference map and refined with restrained geometry to 0.86 (2) Å. The other H atoms were positioned with idealized geometry using a riding model [C—H = 0.93 Å]. All H atoms were refined with isotropic displacement parameters (set to 1.2 times of the *U*<sub>eq</sub> of the parent atom).

### Figures

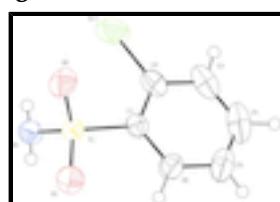

Fig. 1. Molecular structure of (I), showing the atom labelling scheme and displacement ellipsoids are drawn at the 50% probability level.

## 2-Chlorobenzenesulfonamide

### Crystal data

C <sub>6</sub> H <sub>6</sub> CINO <sub>2</sub> S	$F_{000} = 392$
$M_r = 191.63$	$D_x = 1.591 \text{ Mg m}^{-3}$
Monoclinic, <i>Cc</i>	Mo $K\alpha$ radiation, $\lambda = 0.71073 \text{ \AA}$
Hall symbol: C -2yc	Cell parameters from 1188 reflections
$a = 6.955 (1) \text{ \AA}$	$\theta = 2.6\text{--}27.8^\circ$
$b = 14.848 (3) \text{ \AA}$	$\mu = 0.68 \text{ mm}^{-1}$
$c = 7.751 (1) \text{ \AA}$	$T = 299 \text{ K}$
$\beta = 91.51 (1)^\circ$	Prism, colourless
$V = 800.2 (2) \text{ \AA}^3$	$0.48 \times 0.48 \times 0.26 \text{ mm}$
$Z = 4$	

### Data collection

Oxford Diffraction Xcalibur diffractometer with a Sapphire CCD detector	1031 independent reflections
Radiation source: fine-focus sealed tube	1004 reflections with $I > 2\sigma(I)$
Monochromator: graphite	$R_{\text{int}} = 0.008$
$T = 299 \text{ K}$	$\theta_{\max} = 26.4^\circ$
Rotation method data acquisition using $\omega$ and phi scans.	$\theta_{\min} = 2.7^\circ$
Absorption correction: multi-scan (CrysAlis RED; Oxford Diffraction, 2009)	$h = -8 \rightarrow 4$
$T_{\min} = 0.735$ , $T_{\max} = 0.842$	$k = -18 \rightarrow 15$
1598 measured reflections	$l = -9 \rightarrow 9$

### Refinement

Refinement on $F^2$	Hydrogen site location: inferred from neighbouring sites
Least-squares matrix: full	H atoms treated by a mixture of independent and constrained refinement
$R[F^2 > 2\sigma(F^2)] = 0.022$	$w = 1/[\sigma^2(F_o^2) + (0.0417P)^2 + 0.2306P]$
$wR(F^2) = 0.060$	where $P = (F_o^2 + 2F_c^2)/3$
$S = 1.03$	$(\Delta/\sigma)_{\max} = 0.041$
	$\Delta\rho_{\max} = 0.14 \text{ e \AA}^{-3}$

1031 reflections	$\Delta\rho_{\min} = -0.21 \text{ e \AA}^{-3}$
106 parameters	Extinction correction: none
4 restraints	Absolute structure: Flack (1983), 215 Friedel pairs
Primary atom site location: structure-invariant direct methods	Flack parameter: 0.04 (8)
Secondary atom site location: difference Fourier map	

### Special details

**Experimental.** CrysAlis RED (Oxford Diffraction, 2009) Empirical absorption correction using spherical harmonics, implemented in SCALE3 ABSPACK scaling algorithm.

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
