Received 10 August 2009; accepted 11 August 2009

Key indicators: single-crystal X-ray study; $T = 120\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.003\text{ \AA}$; R factor = 0.025; wR factor = 0.077; data-to-parameter ratio = 6.7.

The title compound, $C_{21}H_{26}N_2O_4$, adopts an *E* configuration with respect to the azomethine $\text{C}\equiv\text{N}$ bonds. The dihedral angle between the two rings is $8.16(8)^\circ$. The crystal structure is stabilized by weak intermolecular $\text{C}-\text{H}\cdots\text{O}$ interactions.

N,N'-Bis(2,3-dimethoxybenzylidene)propane-1,3-diamine

K. Fejfarová, A. Dehno Khalaji and M. Dusek

Comment

Schiff bases range among the most chelating ligands found in the field of coordination chemistry (Morshedi *et al.*, 2009a,b). Their compounds with transition metals have wide applications in the field of magnetism (Gao *et al.*, 2003) and catalysis (Ardizzoia *et al.*, 2009). The title compound has been studied as an extension of our work on the structural characterization of bidentate Schiff base compounds with di- and trimethoxy benzaldehyde (Khalaji *et al.*, 2007 and Dehno Khalaji *et al.*, 2009).

The molecule of the title compound is shown in Fig. 1. All bond lengths and angles are comparable with those observed in similar compounds (Khalaji *et al.*, 2007 and Dehno Khalaji *et al.*, 2009). The C7=N1 and C11=N2 bond lengths of 1.264 (2) and 1.263 (2) Å, respectively, conform to the value for a double bonds while C8—N1 and C10—N2 bond lengths of 1.458 (2) and 1.458 (2) Å, respectively, conform to the value for single bonds. The molecule displays an E configuration around the C=N double bond. The azomethine groups are coplanar with the aromatic rings. The dihedral angle between two phenyl rings is 8.16 (8)°. The neighbouring molecules are interconnected by C—H···O hydrogen bonds to infinite chains. These chains are linked by C—H···π interactions into sheets (Fig. 2).

Experimental

2,3-Dimethoxybenzaldehyde (0.2 mmol) and 1,3-propanediamine (0.1 mmol) were dissolved in ethanol (50 ml). The mixture was stirred at room temperature for 1 h to give a clear solution. Suitable crystals of the title compound for X-ray study were formed by slow evaporation of the solvent over 8 days at room temperature (Yield 85%).

Refinement

All hydrogen atoms were discernible in difference Fourier maps and could be refined to reasonable geometry. According to common practice they were nevertheless kept in ideal positions during the refinement. The isotropic atomic displacement parameters of hydrogen atoms were set to 1.2* U_{eq} of the parent atom.

Figures

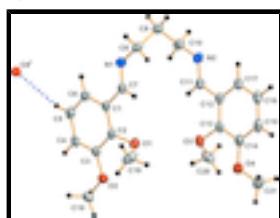

Fig. 1. The molecular structure of the title compound with atom-labeling scheme, with hydrogen bond shown as a dashed line. Displacement ellipsoids are drawn at the 50% probability level. [Symmetry codes: (i) 0.5 - x , 1/2 + y , z - 1/2]

supplementary materials

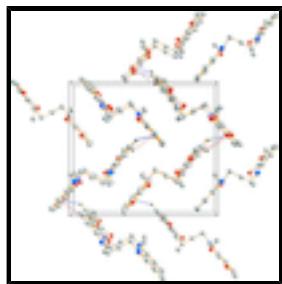

Fig. 2. The packing of (I) viewed along b , with hydrogen bonds shown as blue dashed lines and C—H \cdots π interaction as red dashed lines.

Refinement

Refinement on F^2	H-atom parameters constrained
$R[F^2 > 2\sigma(F^2)] = 0.025$	Weighting scheme based on measured s.u.'s $w = 1/[\sigma^2(I) + 0.0016I^2]$
$wR(F^2) = 0.077$	$(\Delta/\sigma)_{\text{max}} = 0.038$
$S = 1.97$	$\Delta\rho_{\text{max}} = 0.10 \text{ e \AA}^{-3}$
1623 reflections	$\Delta\rho_{\text{min}} = -0.09 \text{ e \AA}^{-3}$

244 parameters

Extinction correction: B–C type 1 Lorentzian isotropic (Becker & Coppens, 1974)

105 constraints

Extinction coefficient: 2800 (1000)

Special details

Experimental. CrysAlisPro (Oxford Diffraction, 2009) Version 1.171.33.34d (release 27-02-2009 CrysAlis171 .NET) Empirical absorption correction using spherical harmonics, implemented in SCALE3 ABSPACK scaling algorithm.

Refinement. The refinement was carried out against all reflections. The conventional R -factor is always based on F . The goodness of fit as well as the weighted R -factor are based on F and F^2 for refinement carried out on F and F^2 , respectively. The threshold expression is used only for calculating R -factors *etc.* and it is not relevant to the choice of reflections for refinement.

The program used for refinement, Jana2006, uses the weighting scheme based on the experimental expectations, see `_refine_ls_weighting_details`, that does not force S to be one. Therefore the values of S are usually larger than the ones from the *SHELX* program.
