Received 12 July 2009; accepted 13 August 2009

Key indicators: single-crystal X-ray study; $T = 294$ K; mean $\sigma(C-C) = 0.005$ Å; R factor = 0.036; wR factor = 0.083; data-to-parameter ratio = 12.7.

In the polymeric title complex, $[Cu(C_7H_3N_2O_2S)_2(H_2O)_2]_n$, the Cu^{II} centre is surrounded by three 1,2,3-benzothiadiazole-7-carboxylate and two water molecules. A 1,2,3-benzothiadiazole-7-carboxylate ligand bridges two Cu^{II} centres, with a $Cu \cdots Cu$ distance of 9.006 (2) Å. The four O atoms in the equatorial planes around each Cu^{II} centre form a distorted square-planar arrangement, while the distorted square-pyramidal coordination is completed by the symmetry-related N atoms of the bridging 1,2,3-benzothiadiazole-7-carboxylate ligands. In the crystal structure, intermolecular O—H···O and O—H···N hydrogen bonds link the molecules into a three-dimensional supramolecular network.

Comment

The design and syntheses of supramolecular complexes exhibiting novel structures and their properties have provided exciting new prospects for chemists (Wang *et al.*, 2008). To date, a number of monometallic extended inorganic-organic composite materials have been synthesized by the combination of organic spacers and inorganic metal salts (Lan *et al.*, 2009). The rational design and construction of complexes greatly depend on the judicious selection of the organic ligands and proper choice of metal centers. Among various ligands, the versatile carboxylic acid ligands exhibiting diverse coordination modes, have been well used in the preparations of various metal-organic complexes, which exhibit interesting applications as functional materials (Hou *et al.*, 2004). 1,2,3-Benzothiadiazole-7-carboxylic acid (HL) known as a disease-resistance activator of plant is a versatile carboxylic acid ligand containing N and S donors for the following reasons: (1) HL has a group –COOH and a thiadiazole ring, in which the O, N and S atoms all could coordinate to metal ions. So HL can act as a bridging ligand. (2) The large conjugated π system of benzothiadiazole ring may act as the directing group for $\pi\cdots\pi$ stacking and C—H $\cdots\pi$ interactions. (3) Both N and O atoms in HL being typical electron donor in forming hydrogen bond, therefore may construct H-bonded supramolecular framework. However, up to now, HL has been largely ignored by coordination chemists and it has not been used for the preparation of metal complexes. We report herein the preparation and crystal structure of the title complex.

In the polymeric title complex, each Cu atom is surrounded by three 1,2,3-benzo-thiadiazole-7-carboxylate and two water molecules. A 1,2,3-benzothiadiazole-7 -carboxylate ligand bridges the two Cu atoms (Fig. 1) with a Cu \cdots Cu distance of 9.006 (2) Å. The four O atoms (O1, O1W, O2W and O4ⁱ) [symmetry code (i): x - 1, y, z] in the equatorial planes around each Cu atom form a distorted square-planar arrangement, while the distorted square-pyramidal coordination is completed by the symmetry related N atoms of the bridging 1,2,3-benzothiadiazole -7-carboxylate ligands (Fig. 2).

In general, several parameters are often used to define the coordination geometries of the penta-coordinated metal centers, and one of the most common parameters is the τ factor defined by Addison *et al.* ($\tau = 0$ for perfect square-pyramidal environment and $\tau = 1$ for trigonal bipyramidal geometry) (Addison *et al.*, 1984). For the title compound, the calculated τ value is 0.173, which corresponds to an approximately square-pyramidal coordination environment.

The Cu-O and Cu-N bonds (Table 1) are in good agreement with the corresponding values reported for Cu-carboxylate, [Cu(H₂O)₂], and Cu-thiadiazole complexes (Lukashuk *et al.*, 2007; Qin *et al.*, 2009). To the best of our knowledge, there is no report on the crystal structures of metal complexes of 1,2,3-thiadiazole, except of a molybdenum pentacarbonyl complex of 4-phenyl-1,2,3-thiadiazole (Batzel & Boese, 1981) and a silver tetrafluoroborate complex of 2-(1,2,3-thiadiazol-4-yl)pyridine (Richardson & Steel, 2002).

In the crystal structure, strong intermolecular O-H \cdots O and O-H \cdots N hydrogen bonds (Table 2) link the molecules into a three-dimensional supramolecular network, in which they may be effective in the stabilization of the structure.

supplementary materials

Experimental

1,2,3-Benzothiadiazole-7-carboxylic acid (*HL*) was prepared according to the method of Fan *et al.* (2005) and Walter & Beat (1997). For the preparation of the title complex, a mixture of cupric nitrate (0.233 g, 1 mmol), *HL* (0.090 g, 0.5 mmol), sodium azide (0.065 g, 1 mmol) and water (12 ml) were placed in a Teflon reactor (23 ml), which was heated to 413 K for 2 d, and then cooled to room temperature at a rate of 5 K h⁻¹. The crystals obtained were washed with water and dried in air (yield; 0.034 g, 30%).

Refinement

H atoms were positioned geometrically with O-H = 0.85 Å (for H₂O) and C-H = 0.93 Å for aromatic H atoms, respectively, and constrained to ride on their parent atoms, with U_{iso}(H) = 1.2U_{eq}(C,O).

Figures

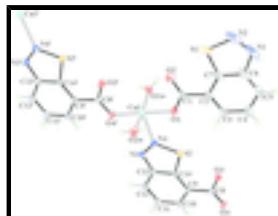

Fig. 1. The molecular structure of the title molecule with the atom-numbering scheme. Displacement ellipsoids are drawn at the 30% probability level [symmetry code: (i) x - 1 , y, z].

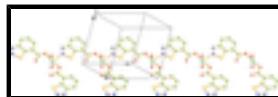

Fig. 2. A partial packing diagram.

Refinement

Refinement on F^2	Secondary atom site location: difference Fourier map
Least-squares matrix: full	Hydrogen site location: inferred from neighbouring sites
$R[F^2 > 2\sigma(F^2)] = 0.036$	H-atom parameters constrained
$wR(F^2) = 0.083$	$w = 1/[\sigma^2(F_o^2) + (0.0321P)^2 + 0.8111P]$ where $P = (F_o^2 + 2F_c^2)/3$
$S = 1.08$	$(\Delta/\sigma)_{\text{max}} = 0.001$
3089 reflections	$\Delta\rho_{\text{max}} = 0.72 \text{ e \AA}^{-3}$
244 parameters	$\Delta\rho_{\text{min}} = -0.70 \text{ e \AA}^{-3}$
Primary atom site location: structure-invariant direct methods	Extinction correction: none

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
