Received 21 August 2009; accepted 1 September 2009

Key indicators: single-crystal X-ray study;  $T = 293\text{ K}$ ; mean  $\sigma(\text{C}-\text{C}) = 0.005\text{ \AA}$ ;  
 $R$  factor = 0.045;  $wR$  factor = 0.109; data-to-parameter ratio = 17.3.

The title compound,  $\text{C}_{15}\text{H}_{25}\text{NO}_3\text{S}$ , was prepared from (*R*)-(-)-camphorsultam and isovaleryl chloride. The asymmetric unit contains two independent molecules with slightly different conformations. In the crystal, weak intermolecular  $\text{C}-\text{H}\cdots\text{O}$  hydrogen bonds link molecules into two independent hydrogen-bonded chains propagating along the *a* and *b* axes.

**Related literature**

The title compound is used to obtain a key intermediate in the synthesis of the new renin inhibitor Aliskiren. For the properties of Aliskiren, see Mariano *et al.* (2008).

### (*R*)-(-)-N-Isovalerylcamphorsultam

**W. Zhou, S. Zhang and W. Hu**

#### Comment

Aliskiren is a new renin inhibitor, useful for the treatment of hypertension and related cardiovascular diseases (Mariano *et al.*, 2008). In the process of synthesis of Aliskiren, the optically active compound ethyl (2*S*, 4*E*)-5-chloro-2-isopropylpent-4-enoate, (2 in Fig 2), is a key intermediate. In order to obtain the compound (2), we used (*R*)-(-)camphorsultam as a chiral supplementary agent (Fig. 2). Thus, the title compound, (1), was prepared by reacting isovaleryl chloride with (*R*)-(-)camphorsultam.

The molecular structure of (1) is illustrated in Fig. 1. The five-membered ring (C4, C5, C10, N1, S1) shows nearly a C5 $\beta$ -envelope conformation, with the atom C5 deviating from the plane C4/C10/N1/S1 by 0.459 (4) Å. The plane formed by atom C2, C3, O3 and N1, have a dihedral angle of 19.6 (2) $^{\circ}$  with the aforementioned plane. In contrast, in the other independent molecule, the five-membered ring(C4', C5', C10', N1', S1') is close to a C10 $\alpha$ -envelope conformation, with the atom C10 deviating from the plane C4'/C5'/N1'/S1' by 0.425 (4) Å. The plane (C2', C3', O3', N1') forms a dihedral angle of 23.9 (2) $^{\circ}$  with the aforementioned plane. Besides, there exist different bond lengths in the two independent molecules. The bond lengths of C1—C2 (1.508 Å), C1—C11 (1.524 Å) and C1—C12 (1.502 Å) are obviously longer than that of C1'-C2' (1.475 Å), C1'-C11' (1.508 Å) and C1'-C12' (1.476 Å), respectively.

In the crystal packing, there are two different intermolecular hydrogen bonds C—H $\cdots$ O (Table 1). The difference in the intermolecular hydrogen bonding interactions most possibly resulted in their slightly different bond lengths and molecular conformations.

#### Experimental

In a 250 ml bottomed flask was added camphorsultam(19 g, 88 mmol), toluene(100 ml), anhydrous triethylamine(16 ml, 110 mmol) and 4-dimethylaminopyridine(1.1 g, 10 mmol). The mixture was cooled to 273 K and then 12 ml of isovaleryl chloride were dripped in twenty minutes. After the addition, the mixture was stirred at 298 K until the TLC test showed that the reaction is complete. A solution of 13 ml of 36% hydrochloride acid in 19 ml of water was added at 298 K. The organic layers were separated and the aqueous layer was extracted for three times with 60 ml of dichloromethane. The combined organic layers were washed with water and concentrated to residue under vacuum, obtaining 26.7 g colourless crystal title compound.(yield 94%, m.p. 403–406 K). Since the crystal product was not found to be suitable for X-ray diffraction studies, a few crystals were dissolved in toluene, which was allowed to evaporate slowly to give colourless crystals of (1) suitable for X-ray diffraction studies.

#### Refinement

All H atoms were placed in calculated positions (C—H 0.96–0.98 Å) and refined as riding with  $U_{\text{iso}}(\text{H}) = 1.2\text{--}1.5 U_{\text{eq}}$  of the parent atom.

### Crystal data

C <sub>15</sub> H <sub>25</sub> NO <sub>3</sub> S	$D_x = 1.268 \text{ Mg m}^{-3}$
$M_r = 299.42$	Mo $K\alpha$ radiation, $\lambda = 0.71073 \text{ \AA}$
Tetragonal, $P4_1$	Cell parameters from 25 reflections
Hall symbol: P 4w	$\theta = 12\text{--}18^\circ$
$a = 7.9038 (7) \text{ \AA}$	$\mu = 0.21 \text{ mm}^{-1}$
$c = 50.228 (8) \text{ \AA}$	$T = 293 \text{ K}$
$V = 3137.8 (7) \text{ \AA}^3$	Prism, colourless
$Z = 8$	$0.30 \times 0.30 \times 0.20 \text{ mm}$
$F(000) = 1296$	

### Data collection

Bruker SMART CCD area-detector diffractometer	6416 independent reflections
Radiation source: fine-focus sealed tube graphite	5184 reflections with $I > 2\sigma(I)$
$\varphi$ and $\omega$ scans	$R_{\text{int}} = 0.035$
Absorption correction: multi-scan ( <i>SADABS</i> ; Sheldrick, 1996)	$\theta_{\text{max}} = 27.5^\circ, \theta_{\text{min}} = 2.6^\circ$
$T_{\text{min}} = 0.939, T_{\text{max}} = 0.959$	$h = -10 \rightarrow 5$
16320 measured reflections	$k = -10 \rightarrow 10$
	$l = -64 \rightarrow 51$

### Refinement

Refinement on $F^2$	Hydrogen site location: inferred from neighbouring sites
Least-squares matrix: full	H-atom parameters constrained
$R[F^2 > 2\sigma(F^2)] = 0.045$	$w = 1/[\sigma^2(F_o^2) + (0.0521P)^2 + 0.2775P]$
$wR(F^2) = 0.109$	where $P = (F_o^2 + 2F_c^2)/3$
$S = 1.04$	$(\Delta/\sigma)_{\text{max}} < 0.001$
6416 reflections	$\Delta\rho_{\text{max}} = 0.38 \text{ e \AA}^{-3}$
	$\Delta\rho_{\text{min}} = -0.19 \text{ e \AA}^{-3}$

370 parameters	Extinction correction: <i>SHELXL97</i> (Sheldrick, 2008), $F_c^* = k F_c [1 + 0.001 x F_c^2 \lambda^3 / \sin(2\theta)]^{1/4}$
1 restraint	Extinction coefficient: 0.0164 (9)
Primary atom site location: structure-invariant direct methods	Absolute structure: Flack (1983), 2779 Friedel pairs
Secondary atom site location: difference Fourier map	Flack parameter: 0.03 (6)

*Special details*

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
