Received 5 August 2009; accepted 2 September 2009

Key indicators: single-crystal X-ray study;  $T = 298\text{ K}$ ; mean  $\sigma(\text{C}-\text{C}) = 0.004\text{ \AA}$ ;  
 $R$  factor = 0.062;  $wR$  factor = 0.165; data-to-parameter ratio = 20.7.

The crystal structure of the title compound,  $\text{C}_7\text{H}_{10}\text{NO}^+\cdot\text{Cl}^-$ , was synthesized by the reaction of 4-methoxyaniline and hydrochloric acid. In the crystal structure, the ions are involved in intermolecular  $\text{N}-\text{H}\cdots\text{Cl}$  hydrogen bonds.

### Related literature

For a similar organic acid-base product, see: Wu *et al.* (2006). This work is part of a systematic investigation of dielectric–ferroelectric materials, including organic ligands, metal–organic coordination compounds and organic–inorganic hybrid materials; see: Li *et al.* (2008); Hang *et al.* (2009).

### Experimental

#### Crystal data

## 4-Methoxyanilinium chloride

M. M. Zhao

### Comment

Acid-base reactions of organic reactants were already widely researched by ancient chemists (Wu *et al.*, 2006). This study is a part of a systematic investigation of dielectric-ferroelectric materials, including organic ligands, metal-organic coordination compounds and organic-inorganic hybrid materials (Li *et al.*, 2008; Hang *et al.*, 2009). Nevertheless, 4-methoxy-anilinium chloride shows no dielectric irregularity in the temperature range of 80 K to 400 K, (m.p. 401 K).

The asymmetric unit of the title compound is composed of cationic ( $\text{CH}_3\text{O}-\text{C}_6\text{H}_4-\text{NH}_3^+$ ) and chloride anions (Fig 1). Intramolecular hydrogen bonds between the ammonium groups of the organic cations and the chloride anions are observed in the crystal structure.

### Experimental

Single crystals of 4-methoxy-anilinium chloride are prepared by slow evaporation at room temperature of 20 mL of an ethanolic solution of 4-methoxyphenylamine and an excess of hydrogen chloride (6 mol/L).

### Refinement

All hydrogen atoms were calculated geometrically with C—H distances of 0.93 Å for aromatic C—H functions, 0.96 Å for the methyl group and 0.89 Å for the ammonium substituent. All hydrogen atoms were allowed to ride on the C and N atoms to which they are bonded with thermal parameters of  $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{parent atom})$ .

### Figures

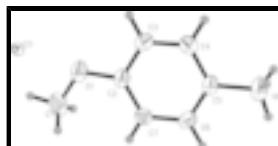

Fig. 1. The molecular structure of the title compound showing the atomic numbering scheme. Displacement ellipsoids are drawn at the 30% probability level.

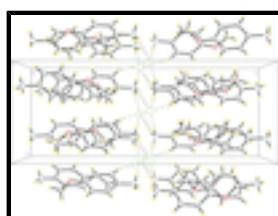

Fig. 2. View of the packing of the title compound, stacking along the *a* axis. Dashed lines indicate hydrogen bonds.

### Crystal data

$C_7H_{10}NO^+\cdot Cl^-$	$F_{000} = 672$
$M_r = 159.61$	$D_x = 1.286 \text{ Mg m}^{-3}$
Orthorhombic, $Pbca$	Mo $K\alpha$ radiation, $\lambda = 0.71073 \text{ \AA}$
Hall symbol: -P 2ac 2ab	Cell parameters from 6458 reflections
$a = 8.905 (2) \text{ \AA}$	$\theta = 3.0\text{--}27.6^\circ$
$b = 8.489 (2) \text{ \AA}$	$\mu = 0.40 \text{ mm}^{-1}$
$c = 21.817 (4) \text{ \AA}$	$T = 298 \text{ K}$
$V = 1649.3 (6) \text{ \AA}^3$	Prism, colourless
$Z = 8$	$0.20 \times 0.20 \times 0.20 \text{ mm}$

### Data collection

Rigaku SCXmini diffractometer	1886 independent reflections
Radiation source: fine-focus sealed tube	1452 reflections with $I > 2\sigma(I)$
Monochromator: graphite	$R_{\text{int}} = 0.058$
Detector resolution: 13.6612 pixels $\text{mm}^{-1}$	$\theta_{\text{max}} = 27.5^\circ$
$T = 298 \text{ K}$	$\theta_{\text{min}} = 3.4^\circ$
$\omega$ scans	$h = -11\text{--}11$
Absorption correction: multi-scan (CrystalClear; Rigaku, 2005)	$k = -10\text{--}11$
$T_{\text{min}} = 0.924$ , $T_{\text{max}} = 0.924$	$l = -27\text{--}28$
15436 measured reflections	

### Refinement

Refinement on $F^2$	Secondary atom site location: difference Fourier map
Least-squares matrix: full	Hydrogen site location: inferred from neighbouring sites
$R[F^2 > 2\sigma(F^2)] = 0.062$	H-atom parameters constrained
$wR(F^2) = 0.165$	$w = 1/[\sigma^2(F_o^2) + (0.0824P)^2 + 0.5018P]$
$S = 1.12$	where $P = (F_o^2 + 2F_c^2)/3$
1886 reflections	$(\Delta/\sigma)_{\text{max}} < 0.001$
91 parameters	$\Delta\rho_{\text{max}} = 0.25 \text{ e \AA}^{-3}$
Primary atom site location: structure-invariant direct methods	$\Delta\rho_{\text{min}} = -0.53 \text{ e \AA}^{-3}$
	Extinction correction: none

### Special details

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations

between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
