Received 28 August 2009; accepted 3 September 2009

Key indicators: single-crystal X-ray study; $T = 100$ K; mean $\sigma(C-C) = 0.003$ Å; R factor = 0.042; wR factor = 0.088; data-to-parameter ratio = 7.0.

The title chiral photochromic Schiff base compound, $C_{16}H_{17}NO_2$, was synthesized from (*R*)-1-phenylethylamine and 5-methoxysalicylaldehyde. The molecule of the title compound exists in the phenol-imine tautomeric form. The dihedral angle between the two aromatic rings is $62.61(11)^\circ$. An intramolecular O–H···N hydrogen bond with an O···N distance of $2.589(2)$ Å is observed. The crystal packing is stabilized by C–H···π interactions involving the aromatic ring.

A chiral photochromic Schiff base: (*R*)-4-methoxy-2-[(1-phenylethyl)iminomethyl]phenol

Y. Miura, Y. Aritake and T. Akitsu

Comment

Because of structural flexibility and their application for switching materials and so on, Schiff base compounds are one of the most extensively used ligands in the field of coordination chemistry (Yamada, 1999). Especially, aiming at multifunctional chiral materials, we have investigated Schiff base Cu^{II}, Ni^{II}, or Zn^{II} complexes in view of thermally induced structural phase transition in the solid state (Akitsu & Einaga, 2004), structural change by occlusion of solvents (Akitsu & Einaga, 2005a), chiral conformational change in a solution induced by a photochromic solute (Akitsu & Einaga, 2005b, 2006a; Akitsu, 2007), and novel induced CD to achiral metallodendrimers (Akitsu *et al.*, 2009). On the other hand, free Schiff base ligands (Akitsu *et al.*, 2004, Akitsu & Einaga, 2006b) have been also studied as multifunctional components, for example photochromic and thermochromic or fluorescence materials (Hadjoudis *et al.*, 2004) and nonlinear optical materials (Sliwa *et al.*, 2005) and so on. In order to clarify the role of electron-donating methoxy group, as free ligands for tautomerism and photochromism (Hadjoudis *et al.*, 1987), crystal structure of the title compound, (I), has been determined.

Crystal structure of (I) is similar to those of the analogous derivatives (Santoni & Rehder, 2004; Akitsu & Einaga, 2006b). Molecule of (I) (Fig. 1) adopts an E configuration with respect to the imine C=N double bond with a C6—C7—N1—C8 torsion angle of -179.40 (18)°. Thus, the π-conjugate system around the imine group is essentially planar. The C1—O1 bond distance of 1.361 (3) Å suggests that it is in the phenol-imine tautomer. The contraction of the C7=N1 bond [1.283 (3) Å] is also in agreement with the phenol-imine tautomer. As for the methoxy group, the O2—C4 and O2—C16 bond distances are 1.374 (3) and 1.422 (3) Å, respectively, and the C4—O2—C16 bond angle is 116.9 (2)°. Beside them, geometric parameters reported here agree with corresponding values reported for analogous Schiff base compounds containing the 1-phenylethylamine group (Antonov *et al.*, 1995; Liu *et al.*, 1997). The planarity of (I) is stabilized by an intramolecular O—H···N hydrogen bond (Table 1). However, there is no intermolecular hydrogen bonds associated with the methoxy group. The crystal packing is stabilized by C—H···π interactions involving the C10-C15 ring.

Experimental

Treatment of equimolar *R*-1-phenylethylamine and 5-methoxysalicylaldehyde in methanol at 298 K overnight gave rise to a yellow-green compound (I). Prismatic crystals of (I) were grown from the resulting solution over a period of several days (yield 39.0%). Analysis found: C 73.98, H 6.49, N 5.37%; calculated for C₁₆H₁₇NO₂: C 75.27, H 6.71, N, 5.49%. (precipitates containing non-stoichiometric crystalline water) m.p. 371 K. IR (Nujol, ν , cm⁻¹): 1632 (imine band). UV-VIS (diffuse reflectance, nm): 255, 329, 470s h.

Refinement

All H atoms were located in a difference map and refined freely [O-H = 0.98 (3) Å and C-H = 0.91 (3)-1.02 (3) Å]. Friedel pairs were merged.

 methods

Special details

Experimental. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > 2\text{sigma}(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.
