Received 14 September 2009; accepted 15 September 2009

Key indicators: single-crystal X-ray study; $T = 100\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.002\text{ \AA}$; R factor = 0.048; wR factor = 0.128; data-to-parameter ratio = 17.5.

In the structure of the title compound, $\text{C}_{13}\text{H}_{17}\text{NO}_4$, the packing is stabilized by weak $\text{C}-\text{H}\cdots\text{O}$ and $\text{C}-\text{H}\cdots\pi$ interactions, resulting in the formation of a three-dimensional network.

Diethyl 2,6-dimethylpyridine-3,5-dicarboxylate at 100 K

W. Ghalem, R. Belhouas, R. Boulcina, S. Bouacida and A. Debaché

Comment

In continuation of our interest in the synthesis and structure determination of nitrogen heterocyclic compounds (*e.g.* Boulcina *et al.*, 2007; Debaché *et al.*, 2008*a*; Debaché *et al.*, 2008*b*), herein, we report synthesis and crystallographic study of the title compound, (I), (Fig. 1), obtained from the oxidation of the corresponding 1,4-DHP.

The asymmetric unit of title compound contains a pyridine four times substituted by two dimethyl and two diethoxycarbonyl groups. As expected, The molecule is approximately planar, the r.m.s. deviation for non-H atoms = 0.130 Å with a maximum deviation from the mean plane = -0.3409 (19) Å for C13 atom.

The crystal structure can be described by two crossed layers which dihydropyridine ring is parallel to (-110) and (110) planes respectively (Fig.2).

The packing is stabilized by weak intermolecular interactions of C—H···O type (Figure 3) and the layers of dihydropyridine are linked together by C—H···π interactions (figure 4) involving the nitrogen heterocyclic ring (*Cg*), resulting in the formation of three dimensional network and reinforcing a cohesion of structure. Hydrogen-bonding parameters are listed in (table 1).

Experimental

A 25-ml round-bottomed flask was charged with ethyl acetoacetate (2.0 mmol), 2-chloroquinoline-3-carboxaldehyde (1.0 mmol) and ammonium acetate (1.0 mmol), followed by 5 ml of water. The mixture was then refluxed until the reaction was completed (monitored by TLC). The reaction mixture was treated with brine solution, then extracted with ethyl acetate. After evaporation of the solvent, the crude yellow product was recrystallized from ethanol to give DHP in 85% yields. A solution of FeCl₃.6H₂O (0.1 mmol) in H₂O (5 ml) was added to the obtained 1,4-dihydropyridines (1 mmol). The reaction mixture was stirred under refluxing until no starting material is detected. After the reaction was completed, the mixture was cooled to room temperature, quenched with 20 ml of H₂O, neutralized with saturated aqueous solution of NaHCO₃, and then extracted with ethyl acetate. The combined organic layer was dried over anhydrous sodium sulfate, and concentrated under a reduced pressure. Colourless blocks of (I) were obtained by a slow recrystallization from toluene.

Refinement

In the final stages of refinement, all H atoms were localized in Fourier maps but introduced in calculated positions, with C—H distances of 0.96 and 0.97 for methylene and methyl H atoms, respectively, and refined using a riding model with $U_{\text{iso}}(\text{H})$ values of $1.5U_{\text{eq}}(\text{C})$ for methyl H atoms and $1.2U_{\text{eq}}(\text{C})$ for methylene H atoms. Except for H3 atom were located in a difference Fourier map and refined isotropically. All non-H atoms were refined with anisotropic atomic displacement parameters.

170 parameters	$\Delta\rho_{\text{min}} = -0.23 \text{ e \AA}^{-3}$
Primary atom site location: structure-invariant direct methods	Extinction correction: none

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
