

## 2-Ethoxy-4-[(2-nitrophenyl)hydrazone]-methylphenol

Zhi-Gang Yin,\* Heng-Yu Qian, Chun-Xia Zhang and Xue-Wen Zhu

Key Laboratory of Surface and Interface Science of Henan, School of Materials and Chemical Engineering, Zhengzhou University of Light Industry, Zhengzhou 450002, People's Republic of China  
Correspondence e-mail: yinck@263.net

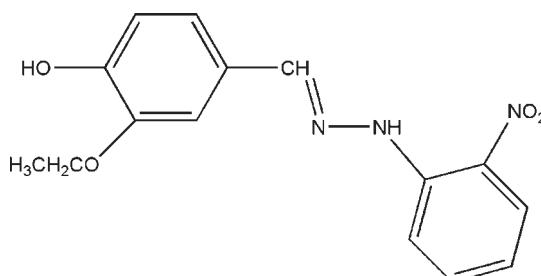

Received 11 September 2009; accepted 12 September 2009

Key indicators: single-crystal X-ray study;  $T = 296\text{ K}$ ; mean  $\sigma(\text{C}-\text{C}) = 0.003\text{ \AA}$ ;  $R$  factor = 0.037;  $wR$  factor = 0.071; data-to-parameter ratio = 13.7.

The title compound,  $\text{C}_{15}\text{H}_{15}\text{N}_3\text{O}_4$ , a Schiff base, was obtained from a condensation reaction of 3-ethoxy-4-hydroxybenzaldehyde and 2-nitrophenylhydrazine. The molecule is approximately planar, the largest deviation from the mean plane being  $0.1449(16)\text{ \AA}$ . An intramolecular  $\text{N}-\text{H}\cdots\text{O}$  interaction is also present. In the crystal, intermolecular  $\text{O}-\text{H}\cdots\text{O}$  hydrogen bonds link the molecules, forming chain parallel to the  $b$  axis.

### Related literature

For the role played by Schiff bases in the development of various proteins and enzymes, see: Kahwa *et al.* (1986); Santos *et al.* (2001).

## 2-Ethoxy-4-[(2-nitrophenyl)hydrazone]methylphenol

Z.-G. Yin, H.-Y. Qian, C.-X. Zhang and X.-W. Zhu

### Comment

The chemistry of Schiff base has attracted a great deal of interest in recent years. These compounds play an important role in the development of various proteins and enzymes (Kahwa *et al.*, 1986; Santos *et al.*, 2001). As part of our interest in the study of the coordination chemistry of Schiff bases, we synthesized the title compound and determined its crystal structure.

The whole molecule is roughly planar with the largest deviation from the mean plane being -0.1449 (16) Å at C15 (Fig. 1).

Intermolecular O—H···O hydrogen bonds link the molecule to form chain parallel to the b axis (Table 1, Fig. 2).

### Experimental

2-Nitrophenylhydrazine (1 mmol, 0.153 g) was dissolved in anhydrous ethanol (15 ml), The mixture was stirred for several minutes at 351k, 3-Ethoxy-4-hydroxybenzaldehyde (1 mmol, 0.166 g) in ethanol (8 ml) was added dropwise and the mixture was stirred at refluxing temperature for 2 h. The product was isolated and recrystallized from methanol, red single crystals of (I) was obtained after 3 d.

### Refinement

All H atoms were positioned geometrically and refined as riding with C—H=0.93 (aromatic), 0.97(methylene), 0.96 Å(methyl) and N—H=0.86 Å, with  $U_{\text{iso}}(\text{H})=1.2U_{\text{eq}}(\text{CH}, \text{CH}_2 \text{ or } \text{NH})$  and  $U_{\text{iso}}(\text{H})=1.5U_{\text{eq}}(\text{C})$ .

### Figures

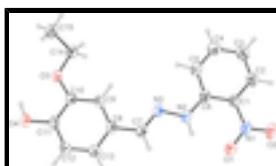

Fig. 1. Molecular view of (I) with the atom labeling scheme. Displacement ellipsoids are drawn at the 30% probability level. H atoms are represented as small spheres of arbitrary radii.

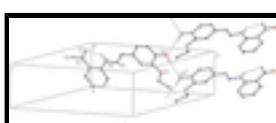

Fig. 2. Partial packing view of (I) showing the formation of a chain through O-H···O hydrogen bonds. H atoms are represented as small spheres of arbitrary radii and H bonds are shown as dashed line. H atoms not involved in hydrogen bonding have been omitted for clarity.[Symmetry codes: (i) -x+1, y+1/2, -z-1/2]

## Refinement

Refinement on $F^2$	Secondary atom site location: difference Fourier map
Least-squares matrix: full	Hydrogen site location: inferred from neighbouring sites
$R[F^2 > 2\sigma(F^2)] = 0.037$	H-atom parameters constrained
$wR(F^2) = 0.071$	$w = 1/[\sigma^2(F_o^2) + (0.0305P)^2]$ where $P = (F_o^2 + 2F_c^2)/3$
$S = 0.72$	$(\Delta/\sigma)_{\max} < 0.001$
2762 reflections	$\Delta\rho_{\max} = 0.13 \text{ e \AA}^{-3}$
201 parameters	$\Delta\rho_{\min} = -0.20 \text{ e \AA}^{-3}$
Primary atom site location: structure-invariant direct methods	Extinction correction: none

## Special details

**Geometry.** All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -

factors(gt) etc. and is not relevant to the choice of reflections for refinement. *R*-factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and *R*-factors based on ALL data will be even larger.
