Received 10 September 2009; accepted 24 September 2009

Key indicators: single-crystal X-ray study;  $T = 123$  K; mean  $\sigma(\text{C-C}) = 0.003$  Å;  $R$  factor = 0.025;  $wR$  factor = 0.061; data-to-parameter ratio = 22.6.

The title compound,  $[\text{Ru}(\text{C}_5\text{H}_5)(\text{C}_3\text{H}_5\text{N})(\text{C}_{18}\text{H}_{15}\text{P})_2]\text{CF}_3\text{SO}_3^-$ , forms yellow crystals with a distinctly hemimorphic habit. It contains a half-sandwich complex of ruthenium with a three-legged piano-stool geometry, with  $\text{Ru}-\text{P} = 2.3585$  (4) and 2.3312 (4) Å, and  $\text{Ru}-\text{N} = 2.0422$  (15) Å as the legs. The  $\text{CF}_3\text{SO}_3^-$  anion is anchored in the crystal lattice by  $\text{C}-\text{H}\cdots\text{O}$  and  $\text{C}-\text{H}\cdots\text{F}$  hydrogen bonds, with  $\text{C}\cdots\text{F}, \text{O}$  distances starting at 3.125 (2) Å.

### Comment

Half-sandwich complexes based on the cationic fragment  $[\text{CpRu}]^+$  ( $\text{Cp}$  = cyclopentadienyl) and complemented by a combination of stabilizing phosphine and labile nitrile ligands are of interest as catalysts in organic chemistry for a variety of useful transformations of unsaturated systems, like C—C bond forming reactions, isomerizations, or C—H activations (Trost *et al.*, 2001). In the context of our research in this area (Rüba *et al.*, 1999, 2002; Mauthner *et al.*, 1999) the title compound was synthesized from  $[\text{CpRu}(\text{PPh}_3)_2\text{Cl}]$  ( $\text{Ph}$  = phenyl) by halide abstraction with  $\text{AgCF}_3\text{SO}_3$  in the presence of propionitrile. As an unconventional but efficient method, technical nitromethane was used as the reaction solvent because it provides good solubility of the reactants, already contains the propionitrile needed for the formation of the title compound, and yields a well crystallized product. Fig. 1 shows the asymmetric unit of the title compound. The cationic ruthenium complex exhibits the well known three-legged piano stool geometry with  $\text{Cp}$  as the seat and  $\text{Ru}—\text{P}1 = 2.3585(4)$  Å,  $\text{Ru}—\text{P}2 = 2.3312(4)$  Å, and  $\text{Ru}—\text{N} = 2.0422(15)$  Å as the legs. The distance between Ru and the centroid of the  $\pi$ -bonded cyclopentadienyl moiety is 1.8579(8) Å (ring slippage 0.052 Å) and the mean value of the  $\text{Ru}—\text{C}$  bond distances is 2.216(19) Å. These dimensions agree well with those of the several related complexes, *e.g.*  $[\text{CpRu}(\text{PPh}_3)_2(\text{NCCH}_3)]\text{BF}_4$  (Carreón *et al.*, 1997) or  $[\text{CpRu}(\text{PPh}_3)_2(\text{NCPh})]\text{PF}_6$  (Cordiner *et al.*, 2003). The conformation of the complex in the title compound is irregular and lacks a frequently encountered feature of  $\text{CpRu}(\text{PPh}_3)_2X$  complexes of having an intramolecular  $\pi$ - $\pi$ -stacking contact between two phenyl rings opposite to the  $\text{Cp}$  ring, present for instance in  $[\text{CpRu}(\text{PPh}_3)_2(\text{NCPh})]\text{PF}_6$  (Carreón *et al.*, 1997). A packing diagram of the crystal structure is shown in Fig. 2. Coherence between the complexes and the  $\text{CF}_3\text{SO}_3^-$  anions is provided by  $\text{C}—\text{H}\cdots\pi$ ,  $\text{C}—\text{H}\cdots\text{O}$  and  $\text{C}—\text{H}\cdots\text{F}$  interactions, the most significant of which are listed in Table 1. Intermolecular  $\pi$ - $\pi$ -stacking interactions are absent in the structure.

### Experimental

The synthesis of the title compound was carried out by stirring stoichiometric amounts of  $[\text{CpRu}(\text{PPh}_3)_2\text{Cl}]$  (Bruce *et al.*, 1982) and  $\text{AgCF}_3\text{SO}_3$  in technical nitromethane at room temperature for several hours. After removing  $\text{AgCl}$  by filtration through celite, the solution was stored over diethyl ether whereupon well faceted blocky yellow crystals precipitated, showing a distinctly hemimorphic habit with a roof like termination on one side of the  $b$ -axis (monoclinic, space group  $P2_1$ ) and a flat base on the other.

### Refinement

All H atoms were placed in calculated positions, with  $\text{C}_{\text{arene}}—\text{H} = 0.95$  Å,  $\text{C}_{\text{alkyl}}—\text{H} = 0.99$  Å and  $\text{C}_{\text{methyl}}—\text{H} = 0.98$  Å and thereafter treated as riding.  $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C}_{\text{arene}}, \text{C}_{\text{alkyl}})$  and  $U_{\text{iso}}(\text{H}) = 1.5U_{\text{eq}}(\text{C}_{\text{methyl}})$  were used.

### Refinement

Refinement on $F^2$	Hydrogen site location: inferred from neighbouring sites
Least-squares matrix: full	H-atom parameters constrained

$R[F^2 > 2\sigma(F^2)] = 0.025$	$w = 1/[\sigma^2(F_o^2) + (0.0394P)^2]$ where $P = (F_o^2 + 2F_c^2)/3$
$wR(F^2) = 0.061$	$(\Delta/\sigma)_{\max} = 0.008$
$S = 1.02$	$\Delta\rho_{\max} = 0.83 \text{ e } \text{\AA}^{-3}$
11391 reflections	$\Delta\rho_{\min} = -0.24 \text{ e } \text{\AA}^{-3}$
505 parameters	Extinction correction: none
1 restraint	Absolute structure: Flack (1983), 5488 Friedel pairs
Primary atom site location: structure-invariant direct methods	Flack parameter: $-0.038(12)$
Secondary atom site location: difference Fourier map	

### Special details

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
