Correspondence e-mail: hongliang1968@yahoo.com.cn

Received 21 September 2009; accepted 24 September 2009

Key indicators: single-crystal X-ray study; $T = 298$ K; mean $\sigma(C-C) = 0.008$ Å; R factor = 0.054; wR factor = 0.162; data-to-parameter ratio = 14.8.

In the title complex, $[Cd(C_{14}H_9N_5)_2](ClO_4)_2$, the Cd^{II} ion is coordinated by two tridentate 2-(1*H*-1,2,4-triazol-1-yl)-1,10-phenanthroline ligands in a distorted octahedral CdN_6 environment. In both 2-(1*H*-1,2,4-triazol-1-yl)-1,10-phenanthroline ligands, the 1,2,4-triazolyl ring and the 1,10-phenanthroline ring system are essentially coplanar [maximum deviations of 0.136 (7) and 0.273 (5) Å, respectively]. The dihedral angle between the mean planes of the ligands is 89.65 (4)°. In the crystal structure, there is a weak $\pi-\pi$ stacking interaction between a pyridine ring and a symmetry-related benzene ring with a centroid–centroid distance of 3.772 (3) Å.

Related literature

Bis[2-(1*H*-1,2,4-triazol-1-yl- κN^2)-1,10-phenanthroline- $\kappa^2 N,N'$]cadmium(II) bis(perchlorate)

H. L. Li

Comment

Derivatives of 1,10-phenanthroline play an important role in modern coordination chemistry (see e.g. Li, 2008; Liu *et al.* 2008), but until now the crystal structure of complexes with 2-(1*H*-1,2,4-triazol-1-yl)-1,10-phenanthroline as a ligand have not been reported. The crystal structure of the title complex is reported herein.

The asymmetric unit of the title complex is shown in Fig. 1. The Cd^{II} ion is coordinated in a distorted octahedral environment. In both 2-(1*H*-1,2,4-triazol-1-yl)-1,10-phenanthroline ligands, the 1,2,4-triazolyl ring and the 1,10-phenanthroline ring system are essentially co-planar within 0.0657 Å (for the ligand containing atom N1) and 0.1073 Å (for the ligand containing atom N6) with a maximum deviations of 0.136 (7) Å and 0.273 (5) Å for atom C6 and atom C27, respectively, and the dihedral angle between the two planes is 89.65 (4)°. In the crystal structure, there is a weak π – π stacking interaction involving a symmetry pyridine ring and symmetry related benzene ring, with the relevant distances being $Cg1 \cdots Cg2^i = 3.772$ (3) Å and $Cg1 \cdots Cg2^{i\text{perp}} = 3.517$ Å [symmetry code: (i) $1 - x, -y, 1 - z$; $Cg1$ and $Cg2$ are the centroids of C1—C5/N2 ring and C4—C9 ring].

Experimental

5 ml H₂O solution of hydrated cadmium perchlorate (0.0535 g, 0.128 mmol) was added into 10 ml methanol solution of 2-(1*H*-1,2,4-triazol-1-yl)-1,10-phenanthroline (0.0631 g, 0.255 mmol) and the mixed solution was stirred for a few minutes. Yellow single crystals were obtained after the filtrate was allowed to stand at room temperature for two weeks.

Refinement

All H atoms were placed in calculated positions and refined as riding with C—H = 0.93 Å and $U_{\text{iso}} = 1.2U_{\text{eq}}(\text{C})$.

Refinement

Refinement on F^2	Secondary atom site location: difference Fourier map
Least-squares matrix: full	Hydrogen site location: inferred from neighbouring sites
$R[F^2 > 2\sigma(F^2)] = 0.054$	H-atom parameters constrained
$wR(F^2) = 0.162$	$w = 1/[\sigma^2(F_o^2) + (0.0899P)^2 + 4.5706P]$
$S = 1.08$	where $P = (F_o^2 + 2F_c^2)/3$
6543 reflections	$(\Delta/\sigma)_{\text{max}} = 0.008$
442 parameters	$\Delta\rho_{\text{max}} = 1.44 \text{ e \AA}^{-3}$
Primary atom site location: structure-invariant direct methods	$\Delta\rho_{\text{min}} = -0.47 \text{ e \AA}^{-3}$
	Extinction correction: none

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations

between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
