Key indicators: single-crystal X-ray study;  $T = 100$  K; mean  $\sigma(C-C) = 0.003 \text{ \AA}$ ;  $R$  factor = 0.042;  $wR$  factor = 0.111; data-to-parameter ratio = 37.8.

The asymmetric unit of the title compound,  $\{[\text{Na}(\text{C}_6\text{H}_{12}\text{O}_6)_2]\text{Cl}\}_n$ , contains six glucose molecules, three  $\text{Na}^+$  ions and three  $\text{Cl}^-$  ions, i.e. three independent  $\{[\text{Na}(\text{C}_6\text{H}_{12}\text{O}_6)_2]\text{Cl}\}$  units. Each of these units forms polymeric chains along the  $c$  axis. Each  $\text{Na}^+$  ion is surrounded by six O atoms from four glucose molecules, forming a distorted octahedral geometry. All glucose molecules adopt chair conformations. The constituent units are linked into a three-dimensional framework by  $\text{O}-\text{H}\cdots\text{Cl}$  and  $\text{O}-\text{H}\cdots\text{O}$  hydrogen bonds, utilizing all the O–H groups.

### Related literature

#### **Comment**

Research in phytochemical study often results in discovery of novel and interesting secondary metabolites from medical plants. *Homalomena sagittifolia* Jungh, which belongs to Araceae family, is a small herb found growing in damp, wet and low open spaces in the forest of Malaysia. The genus *Homalomena* has an overwhelmingly Asian distribution with greatest number of species occurring in archipelagic Malaysia as reported by Sulaiman & Boyce (2005). The folklores regarding the species are rich enough to be mentioned in CRC hand book of medicinal plants (Duke, 1985). In Malaysia, leaves of *H. sagittifolia* are used as a poultice to cure leg sores. A decoction of the rhizomes and leaves is given to drink for fever (Burkill, 1966). So far, no extensive phytochemical study of *H. sagittifolia* has been performed. As part of our on-going search for chemical constituents, we investigated the leaves of *H. sagittifolia*, which lead to isolation of the title compound. Herein, we report the crystal structure of the title compound.

The asymmetric unit contains three independent  $[\text{Na}(\text{C}_6\text{H}_{12}\text{O}_6)_2]^+$  units [say A, B and C] and three  $\text{Cl}^-$  ions (Fig. 1). Each of these independent units form polymeric chains along the *c*-axis. Each  $\text{Na}^+$  ion is surrounded by six O atoms from two independent and two symmetry related glucose molecules to form a distorted octahedral geometry, with  $\text{Na}-\text{O}$  distances ranging from 2.3433 (16) to 2.3966 (15) Å, 2.3455 (15) to 2.3957 (16) Å and 2.3040 (16) to 2.4372 (16) Å, for units *A*, *B* and *C*, respectively, whereas, the angles around the  $\text{Na}^+$  ion range from 68.64 (5) to 138.92 (6)°, 68.99 (5) to 138.99 (6)° and 69.07 (5) to 137.05 (6)° for units *A*, *B* and *C*, respectively. Bond lengths and angles are within normal ranges, and comparable to a closely related structure (Ferguson *et al.*, 1991). All the six independent glucose units in the asymmetric unit adopt chair conformations. The puckering parameters (Cremer & Pople, 1975) are  $Q = 0.580$  (2) Å,  $\Theta = 2.1$  (2)° and  $\varphi = 333$  (6)° for O1A/C1A–C5A ring,  $Q = 0.570$  (2) Å,  $\Theta = 1.3$  (2)° and  $\varphi = 83$  (12)° for O7A/C7A–C11A ring,  $Q = 0.573$  (2) Å,  $\Theta = 0.0$  (2)° and  $\varphi = 31$  (8)° for O1B/C1B–C5B ring,  $Q = 0.577$  (2) Å,  $\Theta = 0.0$  (2)° and  $\varphi = 9$  (11)° for O7B/C7B–C11B ring,  $Q = 0.570$  (2) Å,  $\Theta = 0.0$  (2)° and  $\varphi = 66$  (6)° for O1C/C1C–C5C ring, and  $Q = 0.580$  (2) Å,  $\Theta = 0.4$  (2)° and  $\varphi = 3$  (10)° for O7C/C7C–C11C ring.

In the crystal, the constituent units are linked into a three-dimensional framework (Fig. 3) by  $\text{O}-\text{H}\cdots\text{Cl}$  and  $\text{O}-\text{H}\cdots\text{O}$  hydrogen bonds (Table 1), utilizing all the O-H groups.

#### **Experimental**

The title compound was isolated from the methanolic extract of the leaves of *H. sagittifolia*. The crude extract was fractionated by using Sephadex LH-20 CC eluting with methanol-water (1:1). Fraction-9 was subjected to silica-gel column chromatography, repeatedly eluting with chloroform-methanol solvent mixture with their ratio ranging from 90:10–70:30. Finally, colourless single crystals were grown from a methanol-acetone solution.

## Refinement

O-bound H atoms were initially located in difference maps and later their positions were fixed, with O-H = 0.81–0.93 Å, and refined as riding with the parent atom with  $U_{\text{iso}}(\text{H}) = 1.5U_{\text{eq}}(\text{O})$ . C-bound H atoms were placed in calculated positions, with C–H = 0.97 and 0.98 Å, and refined using a riding model, with  $U_{\text{iso}}(\text{H}) = 1.2 U_{\text{eq}}(\text{C})$ . The crystal under investigation was twinned and the use of the twin law (1 1 0/0 -1 0/0 0 0 -1) resulted in a BASF parameter (SHELXTL; Sheldrick, 2008) of 0.3315 (8).

## Figures

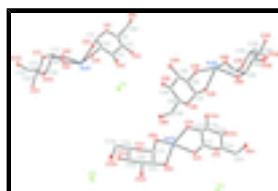

Fig. 1. The asymmetric unit of the title compound, showing the atom-numbering scheme. H atoms have been omitted for clarity.

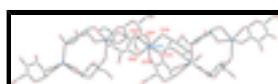

Fig. 2. Part of a polymeric chain formed by Na1A ions, showing the coordination environment. Displacement ellipsoids are drawn at the 50% probability level. H atoms have been omitted for clarity. Symmetry codes: (#) -x+y, 1-x, -1/3+z; (\$) 1-y, 1+x-y, 1/3+z.

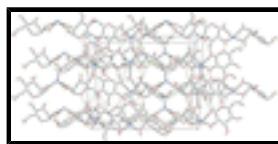

Fig. 3. The crystal packing of the title compound, viewed down the  $a$  axis. Hydrogen bonds are shown as dashed lines. C-bound H atoms have been omitted for clarity.

1 restraint	Extinction correction: none
Primary atom site location: structure-invariant direct methods	Absolute structure: Flack (1983), 13472 Friedel pairs
Secondary atom site location: difference Fourier map	Flack parameter: 0.02 (3)

## Special details

**Experimental.** The crystal was placed in the cold stream of an Oxford Cryosystems Cobra open-flow nitrogen cryostat (Cosier & Glazer, 1986) operating at 100.0 (1) K.

**Geometry.** All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted R-factor wR and goodness of fit S are based on  $F^2$ , conventional R-factors R are based on F, with F set to zero for negative  $F^2$ . The threshold expression of  $F^2 > 2\text{sigma}(F^2)$  is used only for calculating R-factors(gt) etc. and is not relevant to the choice of reflections for refinement. R-factors based on  $F^2$  are statistically about twice as large as those based on F, and R- factors based on ALL data will be even larger.
