Key indicators: single-crystal X-ray study; *T* = 295 K; mean  $\sigma$ (C–C) = 0.005 Å; H-atom completeness 89%; disorder in solvent or counterion; *R* factor = 0.060; *wR* factor = 0.181; data-to-parameter ratio = 17.2.

The title compound,  $\{[\text{Co}(\text{C}_{14}\text{H}_{16}\text{N}_5\text{O}_3)_2 \cdot 2\text{H}_2\text{O}]_n\}$  or  $[\text{Co}(\text{ppa})_2 \cdot 2\text{H}_2\text{O}]_n$ , where ppa denotes the 8-ethyl-5-oxo-2-(piperazin-1-yl)-5,8-dihydropyrido[2,3-*d*]pyrimidine-6-carboxylate anion, was synthesized under hydrothermal conditions. The Co<sup>II</sup> atom (site symmetry  $\bar{1}$ ) exhibits a distorted *trans*-CoN<sub>2</sub>O<sub>4</sub> octahedral geometry defined by two monodentate *N*-bonded and two bidentate *O,O'*-bonded ppa anions. The extended two-dimensional structure is a square grid, which is consolidated by N–H...O hydrogen bonds. The disordered uncoordinated water molecules occupy cavities within the grid.

## Poly[[bis[ $\mu_2$ -8-ethyl-5-oxo-2-(piperazin-1-yl)-5,8-dihydropyrido[2,3-*d*]pyrimidine-6-carboxylato]cobalt(II)] dihydrate]

X. Qi, M. Shao and C.-X. Li

### Comment

Pipemidic acid (Hppa, C<sub>14</sub>H<sub>16</sub>N<sub>5</sub>O<sub>3</sub>, 8-Ethyl-5,8-dihydro-5-oxo-2-(1-piperazinyl)-pyrido(2,3-*d*)-pyrimidine-6-carboxylic acid) is member of a class of quinolones used to treat infections (Mizuki *et al.*, 1996). The manganese and cobalt complexes of the ppa anion have been reported (Huang *et al.*, 2008; Xu *et al.* 2009). The title cobalt(II) complex is reported here (Fig. 1).

The cobalt(II) atom is coordinated by four oxygen atoms and two N atoms from four ppa ligands (two monodentate-N and two *O,O*-bidentate) to form a square grid propagating in (Fig. 2). The disordered, uncoordinated, water molecules occupy the cavities.

### Experimental

A mixture of Co(CH<sub>3</sub>COO)<sub>2</sub>·4H<sub>2</sub>O (0.25 mmol), Hppa (0.5 mmol), sodium hydroxide (1 mmol) and water (12 ml) was stirred for 40 min in air. The mixture was then transferred to a 23 ml Teflon-lined hydrothermal bomb. The bomb was kept at 433 K for 96 h under autogenous pressure. Upon cooling, pink prisms of (I) were obtained from the reaction mixture.

### Refinement

The carbon-bound H atoms were positioned geometrically (C—H = 0.93–0.97 Å) and were included in the refinement in the riding model approximation, with  $U(\text{H}) = 1.2U_{\text{eq}}(\text{C})$ . The H on Nitrogen atoms were located in a difference Fourier map, and were refined with a distance restraint of N—H = 0.86 (1) %Å and with  $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{N})$ .

The water H atoms could not be placed due to this disorder.

### Figures

Fig. 1. The asymmetric unit of (I) expanded to show the metal coordination and polymeric connectivity showing 50% displacement ellipsoids (water molecule O atoms have been omitted for clarity).

Fig. 2. A view of part of a two-dimensional polymeric sheet in (I) showing the square-grid connectivity (H atoms and water molecule O atoms omitted for clarity).

$(\Delta/\sigma)_{\max} = 0.003$

$\Delta\rho_{\max} = 0.77$  e Å<sup>-3</sup>

$\Delta\rho_{\min} = -0.46$  e Å<sup>-3</sup>

Extinction correction: none

*Special details*

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) *etc.* and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
