

## Bis(dicyclohexylphenylphosphine)iodido-silver(I) pyridine monosolvate

Bernard Omondi\* and Reinout Meijboom

Department of Chemistry, University of Johannesburg, PO Box 524, Auckland Park, Johannesburg 2006, South Africa

Correspondence e-mail: boowaga@uj.ac.za

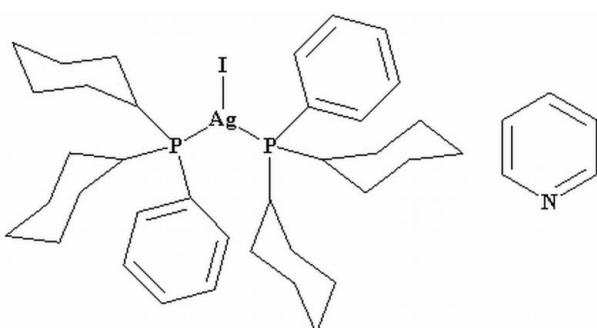

Received 22 September 2009; accepted 6 October 2009

Key indicators: single-crystal X-ray study;  $T = 298\text{ K}$ ; mean  $\sigma(\text{C}-\text{C}) = 0.008\text{ \AA}$ ;  $R$  factor = 0.035;  $wR$  factor = 0.079; data-to-parameter ratio = 24.6.

The structure of the title compound,  $[\text{AgI}(\text{C}_{18}\text{H}_{27}\text{P})_2] \cdot \text{C}_5\text{H}_5\text{N}$ , shows a trigonal-planar coordinated  $\text{Ag}^{\text{I}}$  atom within a distorted  $\text{IAgP}_2$  donor set. The pyridine solvent molecule is only associated with the complex *via* very weak intermolecular  $\text{C}-\text{H} \cdots \text{N}$  interactions.

### Related literature

## Bis(dicyclohexylphenylphosphine)iodidosilver(I) pyridine monosolvate

**B. Omundi and R. Meijboom**

### Comment

Stoichiometric reactions of silver(I) with tertiary phosphines often results in silver(I) complexes of the type  $[\text{AgXL}_n]$  ( $L = \text{tertiary phosphine}$ ;  $n = 1 - 4$ ;  $X = \text{coordinating or non-coordinating anion}$ ). These complexes display a diversity of structural types, and reviews on this topic have been published (Meijboom *et al.*, 2009 and refs. therein). A 1:2 stoichiometric ratio generally results in monomeric complex  $[\text{AgX}(\text{PR}_3)_2]/[\text{Ag}(\text{PR}_3)_2]^+X^-$  or dimeric complex  $[\{\text{AgXL}_2\}_2]$  (Bowmaker *et al.*, 1996; Meijboom *et al.*, 2009) depending on the donor properties of the phosphine ligand, the bulkiness of the ligand substituents and the donor properties of the anion (Bowmaker *et al.*, 1996).

The title complex crystallizes as mononuclear units in the  $P2_1/n$  space group with one  $[\text{AgBr}\{\text{PCy}_2\text{Ph}\}_2]$  complex and one pyridine molecule in the asymmetric unit as expected for the bulky and fairly basic dicyclohexylphenyl phosphine ligands (Lin *et al.*, 1993; Alyea *et al.*, 1982; Bowmaker *et al.*, 1993). This type of  $[\text{AgX}(\text{PR}_3)_2]$  coordination was also observed for  $X = \text{CN}$ , I, Br, Cl, SCN or NCO, most of which were found to be isomorphous in the monoclinic  $C2/c$  space group (Bowmaker *et al.*, 1996).

The iodide anion is unsymmetrically coordinated to the silver with I-Ag-P angles of 105.00 (2) and 122.75 (2) $^\circ$ . The P-Ag-P angle is 131.59 (3) $^\circ$  with the I-Ag distance being 2.7725 (5) Å. These angles and distances are comparable to those of the thiocyanate analogue ( $[\text{AgSCN}(\text{P}\{\text{Cy}_3\})_2]$ ) I-Ag-P = 104.60 (8) and 123.69 (8) $^\circ$  and P-Ag-P = 131.51 (7) $^\circ$  (Bowmaker *et al.*, 1996) both of which have the disposition of the two phosphine ligands fairly different. This fits with trend that relates M-X distances and P-M-P angles as shown by Bowmaker *et al.* (1996) for complexes with bulky phosphines. The three-co-ordinate ( $\text{P}_2\text{AgX}$ ) silver environment is planar with the sum of the I-Ag-P and P-Ag-P angles being 359.3 $^\circ$ . The pyridine solvate interacts very weakly with the silver(I) complex through C-H $\cdots$ N interactions.

Despite the number of structural reports of  $[\text{AgXL}_n]$  complexes, their solution behaviour, initiated by Muettterties & Alegranti (1972), has always shown that the coordinating ligands were labile in all complexes studied. Rapid ligand-exchange reactions have been reported for all  $^{31}\text{P}$  NMR spectroscopic investigations of ionic  $\text{Ag}^+$  monodentate phosphine complexes, thus making NMR spectroscopy of limited use for these types of complexes.

### Experimental

Silver iodide (0.130 g, 0.43 mmol) and dicyclohexylphenylphosphine (1.009 g, 0.86 mmol) were suspended in pyridine (5 ml). The mixture was heated to give a clear solution. Colourless crystals of the title compound suitable for X-ray crystallography were obtained by slow evaporation.

# supplementary materials

---

## Refinement

All hydrogen atoms were positioned geometrically, with C–H = 0.97 Å, and allowed to ride on their parent atoms with  $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C})$ .

## Figures

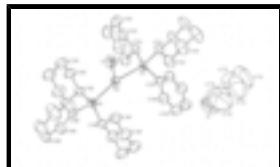

Fig. 1. The molecular structure of (I), showing 50% probability displacement ellipsoids. H atoms have been omitted for clarity.

### Refinement

Refinement on $F^2$	H-atom parameters constrained
Least-squares matrix: full	$w = 1/[\sigma^2(F_o^2) + (0.0275P)^2 + 0.9189P]$

	where $P = (F_o^2 + 2F_c^2)/3$
$R[F^2 > 2\sigma(F^2)] = 0.035$	$(\Delta/\sigma)_{\max} = 0.005$
$wR(F^2) = 0.079$	$\Delta\rho_{\max} = 0.54 \text{ e \AA}^{-3}$
$S = 0.99$	$\Delta\rho_{\min} = -0.59 \text{ e \AA}^{-3}$
10220 reflections	Extinction correction: none
415 parameters	

### Special details

**Geometry.** All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.
