Key indicators: single-crystal X-ray study; $T = 298\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.007\text{ \AA}$; R factor = 0.048; wR factor = 0.142; data-to-parameter ratio = 17.9.

The title dinuclear copper complex, $[\text{Cu}_2(\text{C}_{15}\text{H}_{15}\text{N}_6\text{O})\text{Cl}_2(\text{CH}_3\text{OH})_2]\text{ClO}_4$, was prepared by the reaction of copper(II) chloride with bis[1-(2-pyridyl)ethylidene]carbonohydrazide in the presence of sodium perchlorate in a methanol solution. It features a mono-deprotonated bis-tridentate ligand, which coordinates to two independent Cu^{II} ions, one of which is coordinated by pyridyl N, hydrazyl N and carbonyl O atoms. The second Cu^{II} ion is coordinated by the pyridyl N and two hydrazyl N atoms from different hydrazyl groups. The coordination environments of both Cu^{II} ions are completed by a chloride ion and a methanol molecule. The dihedral angle between the pyridyl groups is $27.46(10)^\circ$. The crystal packing is stabilized by $\text{O}-\text{H}\cdots\text{O}(\text{perchlorate})$, $\text{O}-\text{H}\cdots\text{Cl}$ and $\text{N}-\text{H}\cdots\text{Cl}$ hydrogen bonding.

Comment

Recent research has witnessed considerable interest in the development of new multidentate ligands. Polyamine tripod ligands containing appropriate binding sites and shape may be designed to form special topological structures. The molecular topology of the host molecule can be synthetically modulated to bind many different chemical species from transition metals to lanthanide ions. To this purpose, the title compound was synthesized and structurally characterized. It features a dinuclear copper(II) complex assembled from one mono-deprotonated, bis-tridentate ligand and two distinct copper(II) ions. The coordination of Cu1 is achieved by pyridyl-N, hydrazine-N (deprotonated hydrazine group) and carbonyl-O, Cu2 is coordinated by the second pyridyl-N, hydrazine-N and the second hydrazine-N of the first hydrazine group (Fig. 1). The coordination environments of both Cu^{II} ions are completed by one chloride ion and one methanol molecule. Both of the copper atoms adopt similar distorted 4 + 1 coordinated square-pyramid geometries with a distortion parameter 0.197 for Cu1 and 0.101 for Cu2 (Addison *et al.*, 1984). The crystal packing is stabilised by O-H···O(perchlorate), O-H···Cl and N-H···Cl hydrogen bonding (Fig. 2). The dihedral angle between the pyridyl groups is 27.46 (10)^o.

Experimental

A methanolic solution (15 ml) containing the ligand (0.1 mmol, 0.03 g) was added dropwise to a methanolic solution (10 ml) containing CuCl₂.2H₂O (0.1 mmol, 0.034 g). After stirring for 2 h, the solution was filtered. Dark-green block-shaped crystals suitable for single-crystal X-ray diffraction were obtained by evaporating the resulting filtration in air for several days (yield: 65.6% based on the ligand). Anal calc (%). for C₁₇H₂₃Cl₃Cu₂N₆O₇: H 3.53 C 31.09 N 12.79 Found: H 3.42, C 31.21, N 12.86.

Refinement

C-bound H atoms were placed geometrically and allowed to ride during refinement with C—H = 0.93–0.96 Å with $U_{\text{iso}}(\text{H})$ = 1.2 $U_{\text{eq}}(\text{C})$. O-bound H atoms were located in a difference Fourier map and refined as riding with the parent atom with an isotropic thermal parameter 1.5 times that of the parent atom.

	$\Delta\rho_{\text{min}} = -0.67 \text{ e \AA}^{-3}$

Primary atom site location: structure-invariant direct
Extinction correction: none
methods

Special details

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
