Received 13 September 2009; accepted 23 October 2009

Key indicators: single-crystal X-ray study; $T = 298\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.010\text{ \AA}$; R factor = 0.053; wR factor = 0.112; data-to-parameter ratio = 13.2.

There are two half-molecules in the asymmetric unit of the title compound, $[\text{Cu}_3(\text{C}_{13}\text{H}_9\text{N}_2\text{O}_3)_2(\text{C}_5\text{H}_5\text{N})_4]$, and crystallographic inversion symmetry completes each trinuclear molecule. In both molecules, the central Cu atom (site symmetry $\bar{1}$) adopts a distorted *trans*- $\text{Cu}_2\text{O}_2\text{N}_4$ octahedral geometry, arising from its coordination by two *N,O*-bidentate arylhydrazine ligands and two pyridine molecules. The peripheral Cu atoms adopt *trans*- CuN_2O_2 square-planar coordinations arising from an *N,O,O*-tridentate ligand (that also bonds to the central Cu atom) and a pyridine molecule.

Bis[μ -N'-acetyl-1-oxidonaphthalene-2-carbohydrazidato(3-)tetrapyridinetricopper(II)

J.-P. Gao, W. Zhang, X.-F. Shi and D.-C. Li

Comment

A large number of arylhydrazine complexes have been prepared and studied due to their diverse molecular architectures and quite interesting chemical properties. However, researches on the copper(II) complexes with *N*-acetyl-1-hydroxy-2-naphthoylhydrazide have not reported. So we have synthesized a new complex(Fig.1), which has been characterized by X-ray diffraction and elemental analysis. The triple-deprotonated *N*-acetyl-1-hydroxy-2-naphthoylhydrazide bridged the metal ions using hydrazide N—N group and formed the trinuclear copper complex. As can be seen from Fig.1, there are two trinuclear molecules in the unit cell, molecule A and B. Three copper(II) ions are in a straight line with the Cu—Cu—Cu interatomic angle 180 (12) $^{\circ}$ for A and B. The atomic distance of Cu1—Cu2 and Cu3—Cu4 is 0.4609 nm and 0.491 nm. The coordination geometry of the three Cu atoms exhibit alternating square-planar and octahedral coordination mode. The copper atoms of the center (Cu1 and Cu3) exhibit distorted N₄O₂ octahedral surroundings. However, for the other terminal copper atoms (Cu2 and Cu4), the coordination geometry are square plane. In the crystal packing, the complex molecules are linked into one-dimensional chains by intermolecular C—H···O interactions (Fig. 2)

Experimental

Acetic anhydride (0.52 g, 4 mmol) and 1-hydroxy-2-naphthoylhydrazide (0.808 g, 4 mmol) were added to 40 ml of chloroform at ice-water bath. The reaction mixture was slowly warmed to room temperature and stirred for 24 h. After staying for overnight at refrigerator, the resulting white precipitate was filtered and rinsed with chloroform and diethyl ether m.p.:162–167. An amount of 24.4 mg (0.1 mmol) of *N*-acetyl-1-hydroxy-2-naphthoylhydrazide was dissolved in 10 ml pyridine and 29.9 mg (0.15 mmol) of copper acetate was dissolved in 10 ml DMF. The two solutions were mixed and the combined solution was allowed to stand for 3 weeks, whereupon green blocks of (I) were obtained in 56% yield. Elemental analysis calculated for Cu₆C₉₂H₇₆N₁₆O₁₂: C, 55.84; H, 3.87; N, 11.12. Found (%): C, 55.42; H, 4.06; N, 11.47

Refinement

The H atoms were positioned with idealized geometry (C—H = 0.93–0.96 Å) and refined as riding with $U_{\text{iso}}(\text{H}) = 1.2 U_{\text{eq}}(\text{C})$ or $1.5U_{\text{eq}}$ (methyl C).

Figures

Fig. 1. The molecular structure of (I) showing 30% probability displacement ellipsoids. H atoms have been omitted for clarity.
