Received 30 September 2009; accepted 20 October 2009

Key indicators: single-crystal X-ray study;  $T = 293\text{ K}$ ; mean  $\sigma(\text{C}-\text{C}) = 0.002\text{ \AA}$ ;  $R$  factor = 0.032;  $wR$  factor = 0.091; data-to-parameter ratio = 36.1.

In the title compound,  $[\text{CoCl}(\text{C}_2\text{H}_8\text{N}_2)_2(\text{C}_7\text{H}_9\text{N})]\text{Cl}_2\cdot\text{H}_2\text{O}$ , the  $\text{Co}^{\text{III}}$  ion has a distorted octahedral coordination environment and is surrounded by four N atoms in an equatorial plane, with the other N and Cl atoms occupying the axial positions. The crystal packing is stabilized by  $\text{N}-\text{H}\cdots\text{O}$ ,  $\text{N}-\text{H}\cdots\text{Cl}$  and  $\text{O}-\text{H}\cdots\text{Cl}$  interactions.

### **Chloridobis(ethane-1,2-diamine)(4-methylaniline)cobalt(III) dichloride monohydrate**

**K. Ravichandran, P. Ramesh, C. M. Mahalakshmi, K. Anbalagan and M. N. Ponnuswamy**

#### **Comment**

Mixed ligand cobalt(III) complexes find potential applications in the fields of antitumor, antibacterial, antimicrobial, radiosensitization and cytotoxicity activities (Sayed *et al.*, 1992; Teicher *et al.*, 1990; Arslan *et al.*, 2009; Delehanty *et al.*, 2008). Cobalt is an essential and integral component of vitamin B<sub>12</sub>, therefore it is physiologically found in most tissues. Complexes of cobalt are useful for nutritional supplementation to provide cobalt in a form which effectively increases the bioavailability, for instance, vitamin B<sub>12</sub> by microorganisms present in the gut. In addition, cobalt(III) complexes are known for electron transfer and ligand substitution reactions, which find applications in chemical and biological systems. Against this background and to ascertain the molecular conformation, the structure determination of the title compound has been carried out.

The *ORTEP* diagram of the title compound is shown in Fig. 1. The coordination geometry around the Co<sup>III</sup> ion can be described as a slightly distorted octahedral. The Co<sup>III</sup> ion and the four N atoms almost lie in the same plane, whereas the other N and Cl atoms are approximately perpendicular to this plane. The Co—N and Co—Cl bond lengths are comparable with related complexes (Lee *et al.*, 2007; Ramesh *et al.*, 2008; Anbalagan *et al.*, 2009; Ravichandran *et al.*, 2009). One of the five membered rings in the molecule adopts an envelope conformation, whereas the other ring adopts a twist conformation with the puckering parameters (Cremer & Pople, 1975) and the asymmetry parameters (Nardelli, 1983) for the ring Co1/N1/C2/C3/N4 are:  $q_2 = 0.430$  (1) Å,  $\varphi = 100.4$  (1) $^\circ$  and  $\Delta_2(\text{Co}1) = 9.92$  (9) $^\circ$ ; and for the ring Co1/N5/C6/C7/N8 are:  $q_2 = 0.428$  (2) Å,  $\varphi = 272.0$  (2) $^\circ$  and  $\Delta_2(\text{Co}1) = 1.9$  (1) $^\circ$ .

The crystal packing is controlled by N—H···O, N—H···Cl and O—H···Cl interactions.

#### **Experimental**

The complex was synthesized using dichlorobis(1,2-diamino ethane) cobalt(III) chloride by the reported method (Bailer & Clapp, 1945). A paste was prepared in a mortar with 2 g of *trans*-[Co<sup>III</sup>(en)<sub>2</sub>Cl<sub>2</sub>]Cl crystals in 3–4 drops of deionized water. To the solid mass, about 2.5 g of 4-methyl aniline dissolved in ethanol was added in drops for 20 min. The grinding was continued for half an hour and the color was found to change from dull green to red. The reaction mixture was set aside until no further change was observed and the product was allowed to stand overnight. Finally, the solid was washed with 3–4 times using pure ethanol. The final complex was dissolved in 5–10 ml of deionized water pre-heated to 70°C. The cobalt(III) complex was recrystallized out on addition of few drops of hot conc. HCl and 2 ml of water and cooled. The crystals were filtered, washed with ethanol and dried over vacuum.

#### **Refinement**

Nitrogen and Oxygen H atoms were freely refined. Other H atoms were positioned geometrically (C—H = 0.93–0.97 Å) and allowed to ride on their parent atoms, with 1.5  $U_{\text{eq}}$ (C) for methyl H and 1.2  $U_{\text{eq}}$ (C) for other H atoms.

### *Crystal data*

$[\text{CoCl}(\text{C}_2\text{H}_8\text{N}_2)_2(\text{C}_7\text{H}_9\text{N})]\text{Cl}_2 \cdot \text{H}_2\text{O}$	$Z = 2$
$M_r = 410.66$	$F_{000} = 428$
Triclinic, $P\bar{1}$	$D_x = 1.516 \text{ Mg m}^{-3}$
Hall symbol: -P 1	Mo $K\alpha$ radiation, $\lambda = 0.71073 \text{ \AA}$
$a = 7.3796 (2) \text{ \AA}$	Cell parameters from 5716 reflections
$b = 10.8367 (3) \text{ \AA}$	$\theta = 2.4\text{--}32.8^\circ$
$c = 12.1789 (3) \text{ \AA}$	$\mu = 1.40 \text{ mm}^{-1}$
$\alpha = 75.201 (1)^\circ$	$T = 293 \text{ K}$
$\beta = 74.671 (2)^\circ$	Block, red
$\gamma = 78.862 (1)^\circ$	$0.20 \times 0.20 \times 0.15 \text{ mm}$
$V = 899.86 (4) \text{ \AA}^3$	

### *Data collection*

Bruker Kappa APEXII CCD diffractometer	8633 independent reflections
Radiation source: fine-focus sealed tube	6851 reflections with $I > 2\sigma(I)$
Monochromator: graphite	$R_{\text{int}} = 0.025$
$T = 293 \text{ K}$	$\theta_{\text{max}} = 37.6^\circ$
$\omega$ and $\varphi$ scans	$\theta_{\text{min}} = 1.8^\circ$
Absorption correction: multi-scan (SADABS; Bruker, 2004)	$h = -11 \rightarrow 11$
$T_{\text{min}} = 0.767$ , $T_{\text{max}} = 0.817$	$k = -18 \rightarrow 18$

27923 measured reflections

$l = -20 \rightarrow 20$

### Refinement

Refinement on $F^2$	Secondary atom site location: difference Fourier map
Least-squares matrix: full	Hydrogen site location: inferred from neighbouring sites
$R[F^2 > 2\sigma(F^2)] = 0.032$	H atoms treated by a mixture of independent and constrained refinement
$wR(F^2) = 0.091$	$w = 1/[\sigma^2(F_o^2) + (0.0444P)^2 + 0.0729P]$ where $P = (F_o^2 + 2F_c^2)/3$
$S = 1.10$	$(\Delta/\sigma)_{\max} < 0.001$
8633 reflections	$\Delta\rho_{\max} = 0.50 \text{ e \AA}^{-3}$
239 parameters	$\Delta\rho_{\min} = -0.32 \text{ e \AA}^{-3}$
Primary atom site location: structure-invariant direct methods	Extinction correction: none

### Special details

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
