Key indicators: single-crystal X-ray study;  $T = 293\text{ K}$ ; mean  $\sigma(\text{C}-\text{C}) = 0.004\text{ \AA}$ ;  $R$  factor = 0.053;  $wR$  factor = 0.164; data-to-parameter ratio = 13.8.

In the crystal structure of the title hydrated salt,  $2\text{C}_4\text{H}_{12}\text{N}^+\cdot\text{C}_2\text{O}_4^{2-}\cdot\text{H}_2\text{O}$ , the two independent cations, the anion and the water molecule all lie on special positions of  $m$  site symmetry. In both cations, the mirror plane passes through the nitrogen atom and two methyl groups; in the anion, the mirror plane passes through two carbon and two oxygen atoms. The anions and water molecules interact by  $\text{O}-\text{H}\cdots\text{O}$  hydrogen bonding, forming a chain running along the  $b$  axis.

## Bis(tetramethylammonium) oxalate monohydrate

Y.-X. Yang, Q. Li and S. W. Ng

### Experimental

Oxalic acid (0.126 g, 1 mmol) was dissolved in a water-ethanol (1:2 v/v) mixture and a 25% solution of tetramethylammonium hydroxide was added to neutralize the acid. Colorless block crystals were separated after several weeks.

### Refinement

Carbon-bound H-atoms were placed in calculated positions (C—H 0.96 Å) and were included in the refinement in the riding model approximation, with  $U(H)$  set to  $1.5U(C)$ . The water H-atom was freely refined.

### Figures
