Received 22 September 2009; accepted 29 September 2009

Key indicators: single-crystal X-ray study; $T = 296\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.003\text{ \AA}$; disorder in solvent or counterion; R factor = 0.044; wR factor = 0.101; data-to-parameter ratio = 15.8.

In the title compound, $\text{C}_{10}\text{H}_7\text{NO}_2\text{S}_2 \cdot 0.5\text{CH}_3\text{OH}$, the dihedral angle between the aromatic rings is $11.43(11)^\circ$ and a short intramolecular $\text{C}-\text{H}\cdots\text{S}$ contact occurs. The methanol solvent molecule is equally disordered over two sets of sites. In the crystal, inversion dimers linked by pairs of $\text{N}-\text{H}\cdots\text{O}$ hydrogen bonds occur. The methanol solvent molecule connects the dimers through $\text{O}-\text{H}\cdots\text{S}$ and $\text{O}-\text{H}\cdots\text{O}$ intermolecular hydrogen bonds. Further stability is afforded by $\text{C}-\text{H}\cdots\pi$ and $\pi-\pi$ interactions [centroid–centroid separation = $3.5948(13)\text{ \AA}$].

(5Z)-5-(2-Hydroxybenzylidene)-2-thioxo-1,3-thiazolidin-4-one methanol hemisolvate

D. Shahwar, M. N. Tahir, M. A. Raza, B. Iqbal and S. Naz

Comment

The title compound (I, Fig. 1) has been prepared owing to medicinal properties of rhodanine derivatives.

The crystal structure of (II) (Z)-5-(2-Fluorobenzylidene)-2-thioxothiazolidin-4-one (Delgado *et al.*, 2006) and (III) 5-(2-Hydroxybenzylidene)-2-thioxo-1,3-thiazolidin-4-one dimethylsulfoxide solvate (Barreiro, *et al.*, 2007) have been published. The title compound (I) differs from (III) due to solvate i.e methanol instead of dimethylsulfoxide.

The title molecule basically consists of dimers due to intermolecular H-bondings of N—H···O type with $R_2^2(8)$ ring motifs (Bernstein *et al.*, 1995). There exist a strong intermolecular H-bonding of C—H···S type and two weak intramolecular H-bondings of C—H···O (Table 1, Fig. 2) forming a twisted S(6) and two planar S(5) ring motifs. In (I), the 2-Hydroxybenzylidene moiety A (C1—C7/O1) and the rhodanine moiety B (C8/C9/N1/C10/S1/S2/O2) are planar with maximum r.m.s. deviations of 0.0042 and 0.0044 Å, respectively from their mean square planes. The dihedral angle between A/B is 11.35 (10)°. The methanol solvent of crystallization connects the dimers through O—H···S and O—H···O intermolecular H-bondings and form another ring motif $R_3^3(10)$ (Fig. 2). The molecules are stabilized in the form of two dimensional polymeric networks due to C—H···π interaction (Table 1) and π—π interactions between the centroids of heterocyclic ring $Cg1$ (C8/C9/N1/C10/S1) and the benzene ring $Cg2$ (C1—C6). The distance between $Cg1\cdots Cg2^i$ [symmetry code $i = x, 1 + y, z$] and $Cg2\cdots Cg1^{ii}$ [symmetry code $ii = x, -1 + y, z$] is 3.5948 (13) Å.

Experimental

Rhodanine (0.266 g, 0.2 mol), salicylaldehyde (0.244 g, 0.2 mol) and K_2CO_3 (0.553 g, 0.4 mol) were dissolved in 10 ml distilled water at room temperature. The stirring was continued for 24 h and reaction was monitored by TLC. The precipitates were formed during neutralization of the reaction mixture with 5% HCl. The precipitates were filtered off and washed with saturated solution of NaCl. The crude material obtained was recrystallized in methanol to afford light red needles of (I).

Refinement

The multiplicity factor of C and O atom of methanol was initially refined and later it was fixed to 0.5.

The coordinates of H-atom of hydroxy group were refined. The coordinates of H-atoms of methanol were also refined with constraints. The H-atoms were positioned geometrically with N—H = 0.86, C—H = 0.93 Å for aromatic like H atoms and constrained to ride on their parent atoms, with $U_{iso}(H) = xU_{eq}(C, N, O)$, where $x = 1.5$ for methyl H-atoms and $x = 1.2$ for all other H atoms.

supplementary materials

Figures

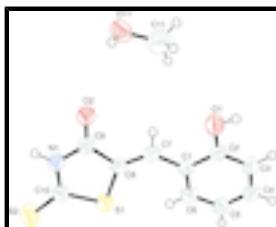

Fig. 1. View of (I) with displacement ellipsoids drawn at the 50% probability level. H-atoms are shown by small circles of arbitrary radius.

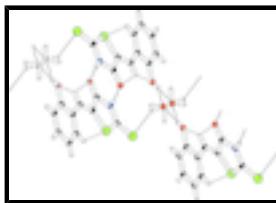

Fig. 2. The partial packing of (I), which shows that molecules form dimers and dimers are connected to each other with the help of methanol by intermolecular H-bondings. The double dotted lines represent intramolecular H-bondings.

Refinement

Refinement on F^2	Secondary atom site location: difference Fourier map
Least-squares matrix: full	Hydrogen site location: inferred from neighbouring sites
$R[F^2 > 2\sigma(F^2)] = 0.044$	H atoms treated by a mixture of independent and constrained refinement
$wR(F^2) = 0.101$	$w = 1/[\sigma^2(F_o^2) + (0.0357P)^2 + 1.2743P]$ where $P = (F_o^2 + 2F_c^2)/3$
$S = 1.03$	$(\Delta/\sigma)_{\max} < 0.001$
2636 reflections	$\Delta\rho_{\max} = 0.30 \text{ e \AA}^{-3}$
167 parameters	$\Delta\rho_{\min} = -0.28 \text{ e \AA}^{-3}$
8 restraints	Extinction coefficient: ?
Primary atom site location: structure-invariant direct methods	

Special details

Geometry. Bond distances, angles etc. have been calculated using the rounded fractional coordinates. All su's are estimated from the variances of the (full) variance-covariance matrix. The cell e.s.d.'s are taken into account in the estimation of distances, angles and torsion angles

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
