Received 4 October 2009; accepted 10 October 2009

Key indicators: single-crystal X-ray study; $T = 292\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.005\text{ \AA}$; disorder in main residue; R factor = 0.063; wR factor = 0.188; data-to-parameter ratio = 12.9.

In the title inclusion compound, $\text{C}_{26}\text{H}_{26}\text{N}_4\text{O}_6\cdot\text{C}_2\text{H}_4\text{Cl}_2$, the solvent molecule occupies a cavity inside the clip-type molecule which is based on the glycoluril skeleton with two ethyl acetate substituents on the convex face of the glycoluril system. The dihedral angle between the aromatic rings of the host is $43.59(4)^\circ$ and the centroid–centroid distance is $6.741(5)\text{ \AA}$. The 1,2-dichloroethane molecule adopts a *gauche* conformation enabling it to participate in $\text{C}-\text{H}\cdots\pi$ interactions with the host. The packing motif in the title compound differs from that observed in the crystal structures of the host and in the benzene solvate. The host molecules are linked into tapes by $\pi\cdots\pi$ stacking interactions (centroid–centroid distance = 3.733 \AA) and are further assembled into layers *via* $\text{C}-\text{H}\cdots\text{O}$ interactions. One of the ethyl groups is disordered over two positions with site-occupancy factors of 0.702 (14) and 0.298 (14).

Comment

Molecular clips based on the glycoluril skeleton, which have a well defined geometry due to the rigidity of the fused rings, have been prepared for a wide variety of supramolecular applications, including molecular recognition (Hu *et al.*, 2007), molecular assemblies (Hof *et al.*, 2002), crystal engineering (Wang *et al.*, 2006; Chen *et al.*, 2007),

The title host compound is a kind of molecular receptor, possessing a well defined U-shaped cavity formed by the glycoluril framework with two aromatic side walls. The crystal structures of monoclinic apohost obtained from dichloroethane solution ($C2/c$, $Z' = 1/2$; Wang *et al.*, 2006) and monoclinic benzene solvate, $C_{26}H_{26}N_4O_6 \cdot 0.25C_6H_6$, ($P2_1/c$, $Z' = 2$; Isaacs *et al.*, 1999) have been already reported. Here, we report the structure of a new solvate (P-1, $Z' = 1$), $C_{26}H_{26}N_4O_6 \cdot C_2H_4Cl_2$, crystallized from 1,2-dichloroethane/methanol (3:1 vol.) solution.

In the triclinic pseudopolymorph, the asymmetric unit contains one host molecule and one solvent molecule of 1,2-dichloroethane (Fig. 1). There is a $C-H \cdots \pi$ interaction between the host and the guest. The distance between atom H28B and Cg2 (the centroid of the C21—C26 ring) is 2.67 Å (Table 1).

As solvent molecule occupies the cavity, the title compound exhibits different packing motif than the previously known two monoclinic forms. In Isaacs structure, the molecule was linked into three-dimensional network structure by $\pi\cdots\pi$ stacking, $C-H \cdots \pi$ and $C-H \cdots O$ hydrogen-bonds. In our previously reported structure of the apohost, the ethyl group occupied the cavity with $C-H \cdots \pi$ interactions and the molecules were linked into layers to the *ab* plane by four pairs of $C-H \cdots O$ hydrogen-bonds parallel.

The title molecules are linked into tapes by $\pi\cdots\pi$ stacking interactions. The benzene rings Cg1 (C1—C6) in the molecules at (x, y, z) and $(1 - x, 1 - y, 1 - z)$ are strictly parallel, with an interplanar spacing of 3.589 Å, a ring centroid separation of 3.733 Å and a centroid offset of 1.027 Å. In addition, intermolecular $C-H \cdots O$ (Table 1) hydrogen-bonds link molecules into two-dimensional layer structure.

Experimental

The host compound was synthesized as reported previously (Wang *et al.*, 2006). Crystals of the title compound were obtained by slow evaporation at 293 K of 1,2-dichloroethane/methanol (vol. 3:1) solution.

Refinement

The H atoms from methyl groups were placed in calculated positions, with $C-H = 0.96$ Å, and refined to fit the electron density [$U_{iso}(H) = 1.5U_{eq}(C)$]. Other H atoms were placed in calculated positions, with $C-H = 0.93$ Å (aromatic) and 0.97 Å

supplementary materials

(methylene), and refined in riding mode [$U_{\text{iso}}(\text{H})=1.2U_{\text{eq}}(\text{C})$]. One of the ester ethyl groups (C13,C14) is disordered over two positions. Restraints were imposed on the geometry of the disordered ethyl group and anisotropic displacement parameters. The occupancies of the disordered atoms C13/C13' and C14/C14' refined at 0.702 (14)/0.298 (14).

383 parameters	$\Delta\rho_{\text{min}} = -0.64 \text{ e \AA}^{-3}$
28 restraints	Extinction correction: none
Primary atom site location: structure-invariant direct methods	

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
