

4-(1,3-Thiazolidin-2-yl)phenol**Xue-Mei Yang**

Department of Chemistry, Guangdong Medical College, Dongguan 523808, People's Republic of China

Correspondence e-mail: xuemeiyang131@163.com

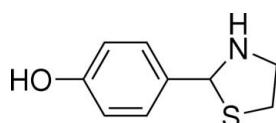

Received 16 September 2009; accepted 14 October 2009

Key indicators: single-crystal X-ray study; $T = 173\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.002\text{ \AA}$; R factor = 0.037; wR factor = 0.105; data-to-parameter ratio = 16.7.

In the title compound, $\text{C}_9\text{H}_{11}\text{NOS}$, the thiazolidinyl ring is almost perpendicular to the phenyl ring with $\text{N}-\text{C}-\text{C}-\text{C}$ torsion angles of $71.7(2)$ and $107.1(2)^\circ$. In the crystal, molecules are connected via $\text{N}-\text{H}\cdots\text{O}$ and $\text{O}-\text{H}\cdots\text{N}$ hydrogen bonds, forming layers.

4-(1,3-Thiazolidin-2-yl)phenol

X.-M. Yang

Comment

In our search for a new synthetic route to imipenem, a carbapenem antibiotic, we got a thiazolidine compound from a reaction of *p*-hydroxybenzaldehyde with 2-amino-ethanethiol, despite of our initial plan to prepare a Schiff base compound. This is consistent with reports that the 2-amino-ethanethiol Schiff base compounds can undergo intramolecular cyclization to form thiazolidines (Al-Sayyab *et al.*, 1968; Thompson & Busch, 1964; Stacy & Strong, 1967).

In the molecular structure (Fig. 1), as it is expected the thiazolidinyl ring is not planar, showing a N(1)—C(1)—C(2)—S(1) torsion angle of -33.7 (2) $^{\circ}$. Furthermore, the thiazolidinyl ring is almost perpendicular to the phenyl ring, with torsion angles N(1)—C(3)—C(4)—C(9) of 71.7 (2) $^{\circ}$ and N(1)—C(3)—C(4)—C(5) of 107.1 (2) $^{\circ}$. In Fig. 1 the chiral center C(3) adopts *R* configuration. Nevertheless, due to space group symmetry a reacemate has been formed and both enantiomers are present in the crystal structure.

In the crystal structure two adjacent molecules are connected *via* N—H···O and O—H···N hydrogen bonds to form centrosymmetric molecule pairs. These pairs are further linked by additional N—H···O and O—H···N intermolecular hydrogen bonds leading to the observed layered supramolecular (Fig. 2).

Experimental

2-Amino-ethanethiol 0.77 g (0.001 mol) was mixed with *p*-hydroxybenzaldehyde 1.22 g (0.001 mol) in ethanol (10 ml) and the mixture refluxed for 2 h. The solvent was evaporated to dryness under reduced pressure and the remaining residue recrystallized from ethanol to afford 1.5 g of yellow block crystals. (Yield 85%). Crystals suitable for X-ray diffraction were obtained by slow evaporation of an ethanolic solution. Spectroscopic analysis: ^1H NMR (DMSO-d₆, δ , p.p.m.): 2.75–2.90 (m, 2H), 2.85–3.05 (m, 2H), 3.50 (m, 1H), 5.35 (s, 1H), 6.70 (d, 2H), 7.25 (d, 2H), 9.35 (s, 1H); elemental analysis, calculated for C₉H₁₁NOS: C, 59.67; H, 6.08; N, 7.73; found: C, 59.33; H, 5.93; N 7.41%.

Refinement

All H-atoms were positioned geometrically and refined using a riding model with d(C—H) = 0.95 Å, $U_{\text{iso}}=1.2U_{\text{eq}}$ (C) for aromatic 1.00 Å, $U_{\text{iso}} = 1.2U_{\text{eq}}$ (C) for CH, 0.99 Å, $U_{\text{iso}} = 1.2U_{\text{eq}}$ (C) for CH₂ and 0.88 Å, $U_{\text{iso}} = 1.5U_{\text{eq}}$ (N) for the NH atoms.

Refinement

Refinement on F^2	Secondary atom site location: difference Fourier map
Least-squares matrix: full	Hydrogen site location: inferred from neighbouring sites
$R[F^2 > 2\sigma(F^2)] = 0.037$	H atoms treated by a mixture of independent and constrained refinement
$wR(F^2) = 0.105$	$w = 1/[\sigma^2(F_o^2) + (0.0611P)^2 + 0.7197P]$ where $P = (F_o^2 + 2F_c^2)/3$
$S = 1.07$	$(\Delta/\sigma)_{\text{max}} < 0.001$
1919 reflections	$\Delta\rho_{\text{max}} = 0.37 \text{ e \AA}^{-3}$
115 parameters	$\Delta\rho_{\text{min}} = -0.17 \text{ e \AA}^{-3}$

Primary atom site location: structure-invariant direct
methods Extinction correction: none

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
