4-(But-3-ynyloxy)-6-(4-iodo-1*H*-pyrazol-1-yl)pyrimidine

Yong-Hong Li, Ru-Liang Xie, Tao Zhang, Xiang-Dong Mei and Jun Ning*

Key Laboratory of Pesticide Chemistry and Applications, Ministry of Agriculture, Institute of Plant Protection Academy of Agricultural Sciences, Beijing 100193, People's Republic of China
Correspondence e-mail: jning502@yahoo.com.cn

Received 22 October 2009; accepted 23 October 2009

Key indicators: single-crystal X-ray study; T = 173 K; mean σ(C–C) = 0.004 Å; R factor = 0.028; wR factor = 0.069; data-to-parameter ratio = 17.6.

In the title compound, $C_{11}H_9IN_4O$, the dihedral angle between the pyrazole and pyrimidine rings is 6.30 (16)°. In the crystal, weak C—H···O interactions link the molecules.

Y.-H. Li, R.-L. Xie, T. Zhang, X.-D. Mei and J. Ning

Comment

Heterocyclic niteo acids and their derivatives are important starting materials in chemical synthesis. They are utilized as precursors to obtain various biologically active compounds (e.g. Ma *et al.*, 2009). Pyrazoles are an important class of compounds, which possess widespread pharmacological properties in agrochemicals (e.g. Shiga *et al.*, 2003). Pyrazolopyrimidine and related fused heterocycles are of interest as potential bioactive molecules. Recently, we have prepared the title compound (I), which has potential herbicidal activity. The crystal structure of the title compound is shown in Fig.1. The bond lengths and angles show no unusual features.

Experimental

The title compound (0.1 g) was dissolved in a mixed solvent of ethanol and acetone (20 ml) at room temperature: colourless blocks of (I) were obtained through slow evaporation after two weeks.

Refinement

All the hydrogen atoms were placed at their geometrical postion with C—H = 0.93–0.98Å and U_{iso}(H) = 1.2–1.5U_{ep}(C).

Figures

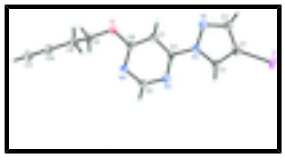

Fig. 1. The molecular structure of (I) showing 50% displacement ellipsoids.

$Z = 4$

Data collection

Rigaku MM007HF + CCD (Saturn724+) diffractometer	2713 independent reflections
Radiation source: Rotating Anode	2577 reflections with $I > 2\sigma(I)$
Monochromator: Confocal	$R_{int} = 0.038$
Detector resolution: 28.5714 pixels mm^{-1}	$\theta_{max} = 27.5°$
$T = 173$ K	$\theta_{min} = 2.2°$
ω scans at fixed $\chi = 45°$	$h = -17\rightarrow25$
Absorption correction: multi-scan (CrystalClear; Rigaku, 2008)	$k = -3\rightarrow5$
$T_{min} = 0.674$, $T_{max} = 0.705$	$l = -19\rightarrow19$
8082 measured reflections	

Refinement

Refinement on F^2	Secondary atom site location: difference Fourier map
Least-squares matrix: full	Hydrogen site location: inferred from neighbouring sites
$R[F^2 > 2\sigma(F^2)] = 0.028$	H-atom parameters constrained
$wR(F^2) = 0.069$	$w = 1/[\sigma^2(F_o^2) + (0.0244P)^2 + 1.6155P]$ where $P = (F_o^2 + 2F_c^2)/3$
$S = 1.11$	$(\Delta/\sigma)_{max} = 0.001$
2713 reflections	$\Delta\rho_{max} = 0.69$ e Å^{-3}
154 parameters	$\Delta\rho_{min} = -0.68$ e Å^{-3}
Primary atom site location: structure-invariant direct methods	Extinction correction: none

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted *R*-factor *wR* and goodness of fit *S* are based on F^2, conventional *R*-factors *R* are based on *F*, with *F* set to zero for negative F^2. The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating *R*-factors(gt) *etc*. and is not relevant to the choice of reflections for refinement. *R*-factors based on F^2 are statistically about twice as large as those based on *F*, and *R*- factors based on ALL data will be even larger.
