Received 18 October 2009; accepted 23 October 2009

Key indicators: single-crystal X-ray study; $T = 173\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.006\text{ \AA}$; R factor = 0.058; wR factor = 0.171; data-to-parameter ratio = 8.2.

The title compound, $\text{C}_{19}\text{H}_{14}\text{N}_2\text{O}_4$, crystallizes with two molecules with very similar conformations in the asymmetric unit; the angles between the two ring systems are 8.7 (1) and 4.2 (1) $^\circ$. In the crystal, intermolecular $\pi-\pi$ interactions [centroid–centroid distance 3.973 (1) \AA] lead to a three-dimensional network.

(E)-2-[2-(2-Nitrophenyl)ethenyl]-8-quinolyl acetate

L.-Y. Zhang and Y.-P. Huo

Comment

8-Hydroxyquinoline derivatives are important constituents in a variety of classes of pharmaceutically important compounds. They have generated interest as a new class of potent HIV-1 integrase inhibitors (Mekouar *et al.*, 1998), for modeling of the inhibition of retroviral integrases (Ouali *et al.*, 2000), as protein tyrosine kinase inhibitors (Chen *et al.*, 2002), as protozoal and retroviral co-infections (Fakhfakh *et al.*, 2003), and as anti-HIV-1 agents (Storz *et al.*, 2004). Zeng, Wang *et al.* (2006) reported that a series of 8-hydroxyquinoline derivatives with vinyl substituents at the 2-position could induce the proliferation of rMSCs (rat mesenchymal stem cells). With these findings, some analogs need to be synthesized for structure activity relationship research to find more potent molecules.

One of these analogs, the title compound, (*E*)-2-[2-(2-nitrophenyl)ethenyl]-8-acetoxyquinoline, was prepared by the Knoevenagel condensation reaction between 8-hydroxyquinaldine and 2-nitrobenzaldehyde (Zeng, OuYang *et al.* (2006)) (Fig. 1). To provide structural information for the title compound, we studied its crystal structure.

The molecular structure of the two molecules per asymmetric unit is illustrated in Fig. 2. In one molecule, the angle between the two ring systems is 8.7 (1) $^{\circ}$; in the other it is 4.2 (1) $^{\circ}$. In this crystal structure, the ethylenic bond lengths for C1—C2 and C26—C27 are 1.322 (5) and 1.329 (5) Å, respectively. The analogous bond reported by Zeng, OuYang *et al.* (2006) has a length of 1.335 (2) Å. Intermolecular π — π interactions, with a centroid···centroid distance of 3.973 (1) Å, lead directly to a three-dimensional supramolecular network (Fig. 3).

Experimental

To a solution of 8-hydroxyquinaldine (1.19 g, 7.5 mmol) in acetic anhydride (5 ml) was added 2-nitrobenzaldehyde (1.12 g, 7.5 mmol). The mixture was heated under reflux for 11 h. After cooling, it was poured into ice water (50 ml) and stirred overnight. The yellow solid obtained was filtered and washed with water. The solid residue was recrystallized from CH₂Cl₂ to afford the title compound (2.04 g, 75%). mp 143–144 °C. 20 mg was dissolved in 10 ml (EtOAc:petroleum ether 1:4) and the solution was kept at room temperature for 4 d. Natural evaporation gave orange single crystals suitable for X-ray analysis.

Refinement

All H atoms were positioned geometrically and refined using a riding model (including free rotation about the acetoxy C—C bond), with C—H = 0.95 Å (Csp²) and 0.98 Å (methyl C); $U_{\text{iso}}(\text{H}) = kU_{\text{eq}}(\text{C})$, where $k = 1.5$ for methyl H atoms and 1.2 for all other H atoms. In the absence of significant anomalous scattering effects, Friedel pairs were merged.

Figures

Fig. 1. The synthesis of (*E*)-2-[2-(2-nitrophenyl)ethenyl]-8-acetoxyquinoline.

supplementary materials

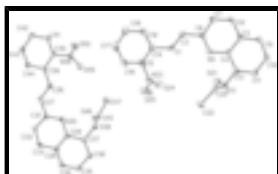

Fig. 2. View of the asymmetric unit of the title compound. Hydrogen atoms have been omitted.

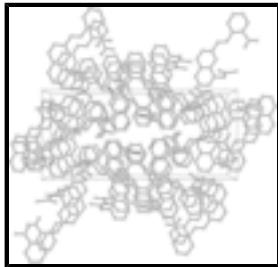

Fig. 3. View of the three-dimensional supramolecular structure.

Special details

Experimental. ^1H NMR (CDCl_3 , 300 MHz) δ 8.17–8.26 (m, 2H), 7.94 (d, $J=7.5$ Hz, 1H), 7.82 (d, $J=7.8$ Hz 1H), 7.64–7.70 (m, 4H), 7.47–7.53 (m, 3H), 2.58(s, 3H); IR (KBr, cm^{-1}): 3067, 1723, 1577, 1520, 1457, 1175, 1128, 970, 850, 765, 708; ESI-MS m/z : 335.9 ($[M+\text{H}]^+$); Elemental analysis: found C: 68.45, H: 4.40, N: 8.38 (%)

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
