Received 2 September 2009; accepted 30 October 2009

Key indicators: single-crystal X-ray study;  $T = 183\text{ K}$ ; mean  $\sigma(\text{P}-\text{O}) = 0.004\text{ \AA}$ ;  $R$  factor = 0.026;  $wR$  factor = 0.066; data-to-parameter ratio = 12.6.

The title compound, CuHPO<sub>4</sub>, has been synthesized from a mixture of phosphoric acid and copper oxide. It has the same composition as  $M\text{HPO}_4$  ( $M = \text{Ca}, \text{Ba}, \text{Pb}, \text{Sr}$  or  $\text{Sn}$ ), but adopts a rhombohedral structure with all atoms on general positions. The structure features distorted PO<sub>4</sub> tetrahedra linked by copper, forming 12-membered rings. The Cu<sup>II</sup> atom is coordinated by five O atoms in a distorted square-pyramidal manner. O—H···O hydrogen bonding leads to an additional stabilization of the structure.

## Copper(II) hydrogenphosphate, CuHPO<sub>4</sub>

C. Günther, H. Görls and D. Stachel

### Comment

The hydrogen phosphate of copper(II) adopts the formula MHPO<sub>4</sub> like other divalent cations. However, the monetites CaHPO<sub>4</sub> (triclinic,  $P\bar{1}$ ; Smith *et al.*, 1955), BaHPO<sub>4</sub> (orthorhombic, Pccn; Bengtsson, 1941) and PbHPO<sub>4</sub> (monoclinic, P2/c or Pc; Bengtsson, 1941) or SrHPO<sub>4</sub> (triclinic,  $P\bar{1}$ ; Boudjada *et al.*, 1978) and SnHPO<sub>4</sub> (monoclinic,  $P2_1/c$ ; Berndt & Lamberg, 1971) have very different structures, which could be due to the much bigger ionic radii of the metals in comparison to copper. CuHPO<sub>4</sub> has a rhombohedral ( $R\bar{3}$ ) structure. The coordination of Cu can be described as a square pyramid, with the apical C–O bond being significantly longer than the other four bonds. The coordination in the base plane could even be described as a strongly squeezed, almost planar tetrahedron (Fig. 1). The Cu ions are linked by distorted PO<sub>4</sub> tetrahedra yielding twelve-membered rings (see Fig. 4, and Fig. 5). The distortion of the phosphate tetrahedra is caused by the OH-groups, which point towards the centre of the rings. There is only one hydrogen bond present in the asymmetric unit (see hydrogen bond geometry). But in the whole crystal structure, this leads to two intramolecular and three intermolecular hydrogen bonds (see Fig. 2 and Fig. 3). In other copper phosphates, the copper atoms are coordinated by four, five and/or six oxygen atoms, respectively (Boudjada, 1980; Sierra *et al.*, 2003; Lukaszewicz, 1966; Robertson & Calvo, 1968; Laügt *et al.*, 1972). CuHPO<sub>4</sub> formed only trigonal bipyramids of CuO<sub>5</sub>.

### Experimental

Phosphoric acid (65%) and copper oxide were mixed in a mortar for several hours. Afterwards the mixture was tempered at 373 K for a week. CuHPO<sub>4</sub> was obtained in the form of emerald-green needles, which decompose by further tempering.

### Refinement

The hydrogen atom of the hydroxyd-group was located by difference Fourier synthesis and refined isotropically.

### Data collection

Bruker–Nonius KappaCCD diffractometer	654 reflections with $I > 2\sigma(I)$
Radiation source: fine-focus sealed tube	$R_{\text{int}}$ = 0.045
Monochromator: graphite	$\theta_{\text{max}}$ = 27.5°
T = 183 K	$\theta_{\text{min}}$ = 3.4°

$\varphi$ and $\omega$ scans	$h = -11 \rightarrow 12$
Absorption correction: none	$k = -12 \rightarrow 12$
3338 measured reflections	$l = -12 \rightarrow 12$
755 independent reflections	

### Refinement

Refinement on $F^2$	Hydrogen site location: inferred from neighbouring sites
Least-squares matrix: full	All H-atom parameters refined
$R[F^2 > 2\sigma(F^2)] = 0.026$	$w = 1/[\sigma^2(F_o^2) + (0.0403P)^2 + 0.166P]$ where $P = (F_o^2 + 2F_c^2)/3$
$wR(F^2) = 0.066$	$(\Delta/\sigma)_{\max} < 0.001$
$S = 1.02$	$\Delta\rho_{\max} = 0.62 \text{ e \AA}^{-3}$
755 reflections	$\Delta\rho_{\min} = -0.66 \text{ e \AA}^{-3}$
60 parameters	Extinction correction: SHELXL97 (Sheldrick, 2008), $F_c^* = kF_c[1 + 0.001x F_c^2 \lambda^3 / \sin(2\theta)]^{-1/4}$
Primary atom site location: structure-invariant direct methods	Extinction coefficient: 0.014 (2)
Secondary atom site location: difference Fourier map	

### Special details

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
