Key indicators: single-crystal X-ray study;  $T = 100$  K; mean  $\sigma(\text{Cu}=\text{O}) = 0.004 \text{ \AA}$ ;  $R$  factor = 0.038;  $wR$  factor = 0.108; data-to-parameter ratio = 16.1.

The title supramolecular polymer,  $[\text{Cu}(\text{S}_3\text{O}_6)(\text{H}_2\text{O})_4]_n$ , features a tetragonally distorted octahedral Cu<sup>II</sup> centre within an O<sub>6</sub> donor set with the longer Cu—O bonds linking the cation and the trithionate dianion. Extensive O—H···O hydrogen-bonding interactions connect the supramolecular chains into a three-dimensional network.

## catena-Poly[[tetraaquacopper(II)]- $\mu$ -trithionato- $\kappa^2 O:O'$ ]

E. R. T. Tieckink

### Comment

The title compound, (I), was obtained from an hydrothermal synthesis (see Experimental) and characterized crystallographically. The asymmetric unit comprises a tetraqua copper(II) cation and a trithionato dianion, Fig. 1. In the crystal structure, the ions are connected as each trithionato dianion bridges two Cu<sup>II</sup> centres thereby forming a supramolecular chain, Fig. 2. The Cu<sup>II</sup> centre exists in a tetragonally distorted O<sub>6</sub> octahedron with the Cu—O<sub>aqua</sub> bonds [2.047 (3) - 2.047 (3) Å] being significantly shorter than the Cu—O<sub>trithionato</sub> bonds [2.524 (3) and 2.564 (3) Å]. The Cu atom lies 0.025 (2) out of the basal plane defined by the four aqua-O atoms (RMS = 0.080 Å) in the direction of the O8<sup>i</sup> atom, and the O5—Cu—O8<sup>i</sup> axial angle is 157.74 (10) ° for i: 1 + x, y, 1 + z. Within the trithionato dianion, the S1—S2 and S2—S3 bond distances are 2.1450 (11) and 2.1184 (12) Å, respectively, and the S1—S2—S3 angle is 101.68 (5) Å. In the crystal structure, there is a considerable number of hydrogen bonding interactions. These occur within the supramolecular chain as well as between chains to form a 2-D array in the ac plane, Fig. 3. Connections between layers lead to a 3-D network, Fig. 4.

Structures containing the trithionato dianion are comparatively rare, with only three such examples (Chun *et al.*, 2000; Díaz de Vivar *et al.*, 2005; Ferrari *et al.*, 1977). In the same way, structures having [Cu(OH<sub>2</sub>)<sub>4</sub>]<sup>2+</sup> centres bridged by bi-functional sulfonato ligands are uncommon (Charbonnier *et al.*, 1977a, b; Pasquale *et al.*, 2007; Wang *et al.*, 2005).

### Experimental

The blue crystal used in the present study was harvested from the hydrothermal reaction of stoichiometric amounts of CuCl, SeS<sub>2</sub>, S, and N<sub>2</sub>H<sub>4</sub>·H<sub>2</sub>O. The reagents were heated to 420 K for 3 d in a 25 ml Teflon-lined stainless-steel autoclave. After the reaction, the bomb was cooled to room temperature. The solution was filtered and layered with methanol. After four weeks, blue needles of (I) were collected and dried in air.

### Refinement

The O-bound H-atoms were located in a difference Fourier map and were refined with O—H and H···H restraints of 0.840±0.001 Å and 1.39±0.01 Å, respectively, and with  $U_{\text{iso}}(\text{H}) = 1.5U_{\text{eq}}(\text{O})$ .

### Figures

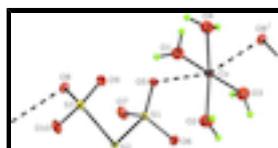

Fig. 1. The asymmetric unit in (I) extended to show the coordination geometry about the Cu atom, showing displacement ellipsoids at the 50% probability level. Symmetry code: (i) 1 + x, y, 1 + z.

## supplementary materials

#### *Data collection*

Bruker SMART APEXII diffractometer	2434 independent reflections
Radiation source: sealed tube graphite	2291 reflections with <i>I</i> > 2σ( <i>I</i> )
$\varphi$ and $\omega$ scans	$R_{\text{int}}$ = 0.020
Absorption correction: multi-scan ( <i>SADABS</i> ; Sheldrick, 1996)	$\theta_{\text{max}} = 27.5^\circ$ , $\theta_{\text{min}} = 1.9^\circ$
	<i>h</i> = -9 → 9

$T_{\min} = 0.911$ ,  $T_{\max} = 1$   
9081 measured reflections

$k = -27 \rightarrow 27$   
 $l = -9 \rightarrow 10$

### Refinement

Refinement on $F^2$	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.038$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.108$	H-atom parameters constrained
$S = 1.03$	$w = 1/[\sigma^2(F_o^2) + (0.0493P)^2 + 7.019P]$ where $P = (F_o^2 + 2F_c^2)/3$
2434 reflections	$(\Delta/\sigma)_{\max} = 0.001$
151 parameters	$\Delta\rho_{\max} = 1.47 \text{ e \AA}^{-3}$
12 restraints	$\Delta\rho_{\min} = -0.84 \text{ e \AA}^{-3}$

### Special details

**Geometry.** All s.u.'s (except the s.u. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell s.u.'s are taken into account individually in the estimation of s.u.'s in distances, angles and torsion angles; correlations between s.u.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell s.u.'s is used for estimating s.u.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > 2\sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
