Key indicators: single-crystal X-ray study; $T = 296\text{ K}$; mean $\sigma(\text{P}–\text{O}) = 0.002\text{ \AA}$; R factor = 0.030; wR factor = 0.072; data-to-parameter ratio = 38.0.

Single crystals of KEu(PO₃)₄, potassium europium(III) polyphosphate, were obtained by solid-state reactions. This monoclinic form is the second polymorph described for this composition and belongs to type IV of long-chain polyphosphates with general formula $A^1B^{III}(\text{PO}_3)_4$. It is isotypic with its KEr(PO₃)₄ and KDy(PO₃)₄ homologues. The crystal structure is built of infinite helical chains of corner-sharing PO₄ tetrahedra with a repeating unit of eight tetrahedra. These chains are further linked by isolated EuO₈ square antiprisms, forming a three-dimensional framework. The K⁺ ions are located in pseudo-hexagonal channels running along [201] and are surrounded by nine O atoms in a distorted environment.

Related literature

Besides crystals of the title compound, crystals of the type III polymorph (Hu *et al.*, 1984) have also been obtained. For isotypic $AB(\text{PO}_3)_4$ structures, where A is an alkali metal, Tl or NH₄⁺, and B is a rare earth element, see: Palkina *et al.* (1977) for TiNd; Maksimova *et al.* (1978) for RbNd; Dago *et al.* (1980) for KEr; Maksimova *et al.* (1981) for CsNd; Maksimova *et al.* (1982) for RbHo; Horchani *et al.* (2004) for RbEr; Rekik *et al.* (2004) for KGd; Naïli & Mhiri (2005) for CsGd; Ben Zarkouna *et al.* (2006) for (NH₄)Gd; Khliissa & Férid (2006) for RbTb; Ettis *et al.* (2006) for RbGd; Chehimi-Moumen & Férid (2007) for KDy; Horchani-Naifer & Férid (2007) for CsPr; Zhu *et al.* (2009) for CsEu. For a review on the crystal chemistry of polyphosphates, see: Durif (1995). Jaouadi *et al.* (2003) have discussed the main crystal chemical characteristics of the seven $AB(\text{PO}_3)_4$ structure types. For applications of rare earth polyphosphates, see: Rashchi & Finch (2000); Barsukov *et al.* (2004). For general background, see: Porai-Koshits & Aslanov (1972). For ionic radii, see: Shannon (1976).

The type IV polymorph of KEu(PO₃)₄

A. Oudahmane, M. Daoud, B. Tanouti, D. Avignant and D. Zambon

Comment

Rare earth polyphosphates are interesting materials and bear potential applications (Rashchi & Finch, 2000; Barsukov *et al.*, 2004). The title compound is a member of a large family of polyphosphates with general formula $A^I B^{III} (PO_3)_4$ (where A^I is a monovalent cation: Li, Na, K, Rb, Cs, Tl, NH₄, Ag and B^{III} is a trivalent cation: Ln, Y, Bi). It is now well known that these compounds are classified into seven structural types usually labelled by roman numerals from I to VII. A short recapitulation of the main crystal chemical characteristics of these seven structural types has recently been given by Jaouadi *et al.* (2003). The KEu(PO₃)₄ polymorph described in this article belongs to the IV structural type.

In the crystal structure the Eu³⁺ ion is eight-coordinated by the oxygen atoms and its 8-coordination polyhedron is better described as a square antiprism than a dodecahedron according to the criteria of Porai-Koshits & Aslanov (1972) ($\delta_1 = 10.37^\circ$, $\delta_2 = 10.85^\circ$, $\delta_3 = 47.97^\circ$, $\delta_4 = 53.54^\circ$). The Eu—O distances range from 2.3199 (19) Å to 2.4827 (19) Å with an average \langle Eu—O \rangle distance of 2.399 Å that is slightly shorter than the sum of the ionic radii *i.e.* 2.466 Å (Shannon, 1976). The structure of this type IV polymorph is built of infinite helical chains of corner-sharing PO₄ tetrahedra further linked by isolated EuO₈ square antiprisms. The (PO₃)_∞ chains exhibit a repeating unit of eight PO₄ tetrahedra (Fig. 1) and are running along the [101] direction. The three-dimensional framework resulting from the edge-sharing between the PO₄ tetrahedra and the EuO₈ square antiprisms exhibits pseudo hexagonal channels where the K⁺ ions reside. The K⁺ ion is 9-coordinated by oxygen atoms with distances ranging from 2.789 (2) Å to 3.370 (3) Å. By sharing corners, the KO₉ coordination polyhedra form corrugated chains running along the [010] direction (Fig. 2). Whereas the K atoms are separated by 6.599 (2) Å within the chain, the shortest K—K distance in the structure, 4.770 (2) Å, occurs between two adjacent (KO₉)_∞ chains. This shortest distance corresponds to the separation between two K⁺ ions within the channels of the structure running along the [201] direction. This separation distance $A^I—A^I$ is strongly dependent on the nature of the A^I element and decreases as the size of the A^I element increases. For instance, in the A^I Gd(PO₃)₄ homologue series, where $A^I = K, Rb, Cs$, this $A^I—A^I$ shortest distance varies from 4.801 Å for K to 4.211 Å for Cs (4.524 Å for Rb). For CsEu(PO₃)₄ the shortest Cs—Cs distance is equal to 4.237 Å (Zhu *et al.* 2009).

For isotypic $AB(PO_3)_4$ structures, where A is an alkali metal, Tl or NH₄⁺, and B is a rare earth element, see: Palkina *et al.* (1977) for TlNd, Maksimova *et al.* (1978) for RbNd, Dago *et al.* (1980) for KEr, Maksimova *et al.* (1981) for CsNd, Maksimova *et al.* (1982) for RbHo, Horchani *et al.* (2004) for RbEr, Rekik *et al.* (2004) for KGd, Naïli & Mhiri (2005) for CsGd, Ben Zarkouna *et al.* (2006) for (NH₄)Gd, Khliissa & Férid (2006) for RbTb, Ettis *et al.* (2006) for RbGd, Chehimi-Moumen & Férid (2007) for KDy, Horchani-Naifer & Férid (2007) for CsPr, and Zhu *et al.* (2009) for CsEu. For a review on the crystal chemistry of polyphosphates, see: Durif (1995).

supplementary materials

Experimental

Crystals of the title compound were synthesized by reacting Eu_2O_3 with $(\text{NH}_4)\text{H}_2\text{PO}_4$ and K_2CO_3 in a platinum crucible. A mixture of these reagents in the molar ratio 34:57:9 was used for the synthesis. The mixture was heated at 473 K for 6 h, then at 573 K for 6 h and finally at 873 K for 24 h. The furnace was then cooled down first to 773 K at the rate of $2 \text{ K}\cdot\text{h}^{-1}$ and then to room temperature at the rate of $\text{K}\cdot\text{h}^{-1}$. Single crystals were extracted from the batch by washing with hot water. Besides crystals of the title compound, crystals of the type III polymorph (Hu *et al.*, 1984) have also been obtained.

Refinement

The highest residual peak in the final difference Fourier map was located 0.68 Å from atom Eu and the deepest hole was located 0.45 Å from atom K.

Refinement

Refinement on F^2	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.030$	$w = 1/[\sigma^2(F_o^2) + (0.0311P)^2 + 1.1689P]$
	where $P = (F_o^2 + 2F_c^2)/3$
$wR(F^2) = 0.072$	$(\Delta/\sigma)_{\text{max}} = 0.002$
$S = 1.04$	$\Delta\rho_{\text{max}} = 1.72 \text{ e \AA}^{-3}$
6201 reflections	$\Delta\rho_{\text{min}} = -2.04 \text{ e \AA}^{-3}$
163 parameters	Extinction correction: none

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
