Received 9 October 2009; accepted 29 October 2009

Key indicators: single-crystal X-ray study; $T = 290$ K; mean $\sigma(C-C) = 0.009$ Å; R factor = 0.042; wR factor = 0.130; data-to-parameter ratio = 14.6.

The hydrothermal reaction of $SrCO_3$ and 2-bromobenzoic acid in CH_3OH-H_2O afforded the Sr^{II} title polymeric complex, $[Sr(C_7H_4BrO_2)_2(H_2O)_2]_n$. Within the coordination sphere, the Sr^{II} ion is located on a crystallographic twofold axis, and is coordinated by eight O atoms from two water molecules and four carboxylate groups of 2-bromobenzoate ligands in an irregular coordination geometry. Two μ_3 -carboxylate groups of the 2-bromobenzoate anions bridge two symmetry-related Sr^{II} atoms, giving rise to a chain structure extending along [001]. The polymeric chains are connected via $O-H\cdots O$ and $O-H\cdots Br$ hydrogen bonds interactions into a three-dimensional supramolecular network.

Comment

Metal ions with 2-bromobenzoato ligands can form, among others, mononuclear, dinuclear complexes (Zhang *et al.*, 2005, 2008; Zhang, 2006; Wang *et al.*, 2003) but very few reports on one-dimensional chain structures complexes including 2-bromobenzoato ligands have been published.

In this paper, we would like to report the synthesis and crystal structure of a one-dimensional chain complex including 2-bromobenzoato and Strontium(II). The crystal structure of the title compound is similar to previously published structures (Zhang, 2008; Karipides *et al.*, 1988). Within the title compound, each Sr^{II} ion is located on a crystallographic two-fold axis and is coordinated by eight O atoms from two water molecules and four carboxyl groups of 2-bromobenzoic acid anions in an irregular coordination geometry. Two μ_3 -carboxyl groups of the 2-bromobenzoic anions bridge two symmetry related Strontium atoms, giving rise to a one-dimensional chain structure extending along the [001] direction, with Sr—O bond lengths in the range of 2.498 (3) to 2.753 (4) Å. Separation between Sr and Sr^{iv} (symmetry code *iv*: -*x*+1, -*y*+2, -*z*+1) is 4.1703 (8) Å (Fig. 1). The polymeric chains are connected via O—H···O and O—H···Br hydrogen bonds interactions in a three-dimensional supramolecular structure (Fig. 2). The O1—H1A···O3 and O1—H1A···Br1 separations are 2.753 Å and 3.603 Å. The O—H···O and O1—H1A···Br1 bond angles are 156° and 164°, Table 2.

Experimental

SrCl₂·6H₂O. (0.533 g, 2.00 mmol) was dissolved in the appropriate amount of water, and then 1M Na₂CO₃ solution was added. SrCO₃ was obtained by filtration, which was then washed with distilled water (5 times). The freshly prepared SrCO₃, 2-bromobenzoic acid (0.402 g, 2.00 mmol), CH₃OH/H₂O (*v/v* = 1:2, 15 ml) were mixed and stirred for 2.0 h. Subsequently, the resulting cream suspension was heated in a 23 ml Teflon-lined stainless steel autoclave at 433 K for 5800 minutes. After the autoclave was cooled to room temperature according to the procedure at 2600 minutes, the solid was filtered off. The resulting filtrate was allowed to stand at room temperature, and slow evaporation for 6 weeks afforded colorless block-shaped single crystals.

Refinement

C-bound H atoms were placed in calculated positions, with C—H = 0.93 Å and $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C})$, and were refined using the riding- model approximation. The H atoms of the water molecule were located in a difference Fourier map and refined with an O—H distance restraint of 0.82 (1) Å and $U_{\text{iso}}(\text{H}) = 1.5U_{\text{eq}}(\text{O})$.
