Received 19 October 2009; accepted 5 November 2009

Key indicators: single-crystal X-ray study; $T = 298\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.004\text{ \AA}$; R factor = 0.019; wR factor = 0.044; data-to-parameter ratio = 16.2.

The asymmetric unit of the title compound, $[\text{Er}_2(\text{C}_{10}\text{H}_8\text{O}_6)_3(\text{H}_2\text{O})_4]\cdot 6\text{H}_2\text{O}$, comprises one Er^{3+} ion, one and a half 2,2'-(*p*-phenylenedioxy)diacetate (hqda) ligands, two coordinated water molecules and three uncoordinated water molecules. The Er^{3+} ion is nine-coordinated by seven O atoms from hqda ligands and two O atoms from water molecules. In the title compound, there are two types of crystallographically independent ligands: one with an inversion center in the middle of the ligand is chelating on both ends of the ligand towards each one Er center; the other hqda ligands are bridging-chelating on one side, and bridging on the other end of the ligand. Two adjacent Er^{3+} ions are thus chelated and bridged by -COO groups from hqda ligands in three coordination modes (bridging-chelating, bridging and chelating). These building blocks are linked by $\text{OOC}-\text{CH}_2\text{O}-\text{C}_6\text{H}_4-\text{OCH}_2-\text{COO}$ spacers, forming two-dimensional neutral layers. Adjacent layers are linked by $\text{O}-\text{H}\cdots\text{O}$ hydrogen-bonding interactions, forming a three-dimensional supermolecular network.

Comment

The investigation of the assembly of metal-organic frameworks (MOFs) has attracted great interest due to their versatile architecture and promising applications for ion exchange, gas storage, separation, and catalysis (Maji *et al.*, 2005; Moulton & Zaworotko 2001; Rao *et al.*, 2004; Sun *et al.*, 2006; Zou *et al.*, 2006). The selection of multifunctional bridging ligands is crucial to synthesize novel MOFs (Burrows *et al.*, 2000; Huang *et al.*, 2005). Among these, hydroquinone-*O,O'*-diacetic acid (H₂hqda) is a good ligand in the preparation various metal-organic coordination polymers. Recently, several lanthanide(III) hqda compounds with fascinating structures have been reported (Hong *et al.*, 2006; Li *et al.*, 2008). Herein, we report a new compound [Er₂(hqda)₃(H₂O)₄].6H₂O.

The asymmetric unit of the title compound comprises one Er³⁺ ion, one and a half 2,2'-(*p*-phenylenedioxy)diacetate anions (hqda), two coordinated water molecules and three lattice water molecules. The Er³⁺ ion is nine coordinated by seven oxygen atoms of hqda ligands and two oxygen atoms of aqua ligands (Fig 1). The Er—O (carboxylate) distances fall in the range 2.341 (2)–2.529 (2) Å, and those of the Er—O (water) bonds are 2.317 (2) Å and 2.368 (2) Å, respectively. The coordination environment of the Er³⁺ ion may be described as a distorted tricapped trigonal prism. In the title compound, there are two types of crystallographically independent ligands. One type with an inversion center in the middle of the ligand is chelating on both ends of the ligand towards each one Er center. The other type is bridging-chelating on one side, and bridging on the other, thus connecting each two Er centers with each other. Two adjacent Er³⁺ ions are thus chelated and bridged by –COO groups from hqda ligands in three coordination modes (bridging-chelating, bridging and chelating modes) to form [Er₂(hqda)₃(H₂O)₄].6H₂O building blocks. These building blocks are linked by the OOC—CH₂O—C₆H₄—OCH₂COO (hqda) spacers to form two-dimensional neutral layers perpendicular to the [100] direction (Fig 2). The lattice water molecules are sandwiched between these two-dimensional layers and hydrogen bonded with them. The adjacent two-dimensional layers are further interlinked by these hydrogen bonds to form a three-dimensional supermolecular network.

Experimental

All commercially available chemicals were of reagent grade and used without further purification. Er(NO₃)₃.6H₂O (0.0922 g, 0.2 mmol) and H₂hqda (0.0452 g, 0.2 mmol) were added to a stirred solution of 20 ml dimethyl formamide/H₂O to form a clear solution, which was mixed with 5 ml ethanol and 0.15 ml triethylamine. The resulting solution was kept at room temperature and pink, block-like crystals grew after ca. 20 days.

supplementary materials

Refinement

H atoms bonded to C atoms were placed in geometrically calculated positions and refined using a riding model, with distances of C—H = 0.93 Å (benzene ring) and 0.97 Å (—CH₂), and $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C})$. Water H atoms were positioned geometrically and refined with distance restraints of O—H = 0.82 (2) Å and $U_{\text{iso}}(\text{H}) = 1.5U_{\text{eq}}(\text{O})$.

Figures

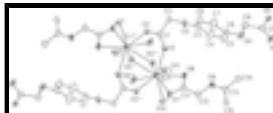

Fig. 1. ORTEP view of complex molecule of the title compound. Displacement ellipsoids are drawn at the 45% probability level. H atoms and lattice water molecules were omitted for clarity. (Symmetry codes: ii = -x + 1, -y + 1, -z; iii = x, y, z-1; iv = x - 1, y, z; v = -x + 2, -y + 2, -z).

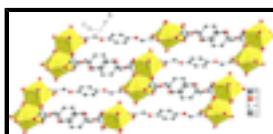

Fig. 2. Two-dimensional layer in the title compound perpendicular to the [100] direction with H-atoms and lattice water molecules omitted.

Primary atom site location: structure-invariant direct methods	

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
