Received 15 September 2009; accepted 23 November 2009

Key indicators: single-crystal X-ray study; $T = 293\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.015\text{ \AA}$; R factor = 0.047; wR factor = 0.128; data-to-parameter ratio = 12.3.

The title compound, tris(4,4'-bipyridinium) diarsenoctadecamolybdate(VI), $(C_{10}H_{10}N_2)_3[As_2Mo_{18}O_{62}]$, featuring protonated bipyridine molecules and a classical Dawson-type polyoxo-anion, has been synthesized under hydrothermal conditions. The polyoxoanions are linked together via the bipyridyl cations, acting as hydrogen-bond donors, generating a two-dimensional supramolecular network. The asymmetric unit contains 1.5 4,4'-bipyridinium (H_2bpy) units, with an inversion centre in the central bond of the second H_2bpy unit. The site symmetry of the anion is $\bar{1}$.

Comment

POMs (polyoxometalates), as a class of metal oxide clusters, possess an enormous structural variety and interesting electronic properties. They have therefore been extensively employed in the construction of functional materials (Haushalter *et al.*, 1989; Pope & Müller, 1991). The A/Mo/P/O system as an important part of this family of compounds has been synthesized and structurally characterized, where A is an organic or inorganic cation. In contrast to the rich structural chemistry of molybdenum phosphates, the Mo/As/O system remains relatively scarcely developed.(Rao *et al.*, 2001; Cheetham *et al.*, 1999; Xiao *et al.*, 1999; Thomas & Raja 2001.) On the basis of these facts, we have hydrothermally synthesized and characterised a new arsenate compound $(\text{H}_2\text{bpy})_3[\text{As}_2\text{Mo}_{18}\text{O}_{62}]$, which is described here.

The structure of compound consists of a discrete polyoxoanion $[\text{As}_2\text{Mo}_{18}\text{O}_{62}]^{6-}$ and three bipyridine molecules (Fig 1). The centrosymmetric polyoxoanion is classical α -Dawson isomer $[\alpha\text{-As}_2\text{Mo}_{18}\text{O}_{62}]^{6-}$. The parent anion $[\alpha\text{-As}_2\text{Mo}_{18}\text{O}_{62}]^{6-}$ consisting of two central AsO_4 tetrahedra which are surrounded by six vertex-sharing Mo_3O_{13} trimers, also may be described as two $[\alpha\text{-AsMo}_9\text{O}_{31}]^{3-}$ units, generated from the well known $[\alpha\text{-AsMo}_{12}\text{O}_{40}]^{3-}$ by removal of a set of three corner-sharing MoO_6 octahedra and fused into a cluster of virtual D_{3h} symmetry. In the Dawson type POM, there are two structurally distinct types of Mo atoms: six 'cap' atoms on vertical mirror-planes and grouped in two sets of three, and twelve equatorial Mo atoms are grouped in two sets of six, but do not lie on mirror-planes (Wang *et al.*, 2004).

The unusual feature of the title compound is that it exhibits a 2-D supramolecular layer-like structure formed by the discrete Dawson-type anions and 4,4'-bpy molecules *via* multi-point N—H \cdots O hydrogen-bonding interactions (Fig. 2). As a fundamental building unit, each of the polyoxoanion $[\text{As}_2\text{Mo}_{18}\text{O}_{62}]^{6-}$ acting as a hexa-dentate ligand furnishes four two-bridging and two terminal oxygen atoms to connect to six adjacent 4,4'-bipy molecules *via* N—H \cdots O hydrogen-bonding interactions. In particular, oxygen atoms (O14, O26ⁱ, O29 and O12ⁱ; symmetry code: (i) $x - 1, 1 + y, z$) connect adjacent four 4,4'-bipy molecules to form a 1-D "double-bridge" chain (chain A), respectively. The oxygen atoms (O7, O10, O7ⁱ and O10ⁱ) link two 4,4'-bipy molecules to construct an undulated chain (chain B). The chains A and B further link each other to form a novel 2-D layer-like structure with 1-D rhombic channel.

Experimental

The title compound was hydrothermally synthesized under autogenous pressure. A mixture of $\text{FeCl}_3 \cdot 6\text{H}_2\text{O}$ (0.41 g, 2.5 mmol), As_2O_3 (0.5 g, 2.5 mmol), $\text{MoO}_3 \cdot 2\text{H}_2\text{O}$ (0.9 g, 5 mmol), 4,4'-bipy $\cdot 2\text{H}_2\text{O}$ (0.32 g, 1.7 mmol) and 18 ml water was stirred for 30 min in air; it was adjusted to pH=5–6 with 2M KOH, and was heated in a 25 ml stainless steel reactor with a Teflon-liner at 180°C for 8 days, and then cooled to room temperature. The resulting product consisting of brown block-shaped crystals was isolated by filtration, washed with distilled water, and dried at ambient temperature (75% yield based on Mo). Elemental

Special details

Experimental. (See detailed section in the paper)

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
