

1-Methyl-4,5-dinitro-1*H*-imidazole**Yong-Xiang Li, Xiao-Jun Wang and Jian-Long Wang***

School of Chemical Engineering and Environment, North University of China,
Taiyuan, People's Republic of China
Correspondence e-mail: wangjianlong@nuc.edu.cn

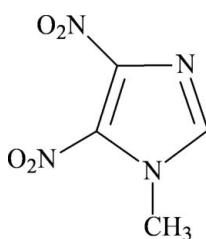

Received 7 October 2009; accepted 7 November 2009

Key indicators: single-crystal X-ray study; $T = 293\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.004\text{ \AA}$;
 R factor = 0.046; wR factor = 0.112; data-to-parameter ratio = 7.8.

In the title compound, $\text{C}_4\text{H}_4\text{N}_4\text{O}_4$, the two nitro groups are twisted with respect to the imidazole plane, making dihedral angles of 24.2 (3) and 33.4 (4) $^\circ$. In the crystal structure, the molecules are linked through non-classical intermolecular C—H···O hydrogen bonds.

1-Methyl-4,5-dinitro-1*H*-imidazole

Y.-X. Li, X.-J. Wang and J.-L. Wang

Comment

Polynitroimidazole systems have been investigated extensively owing to their biological activity (Hofmann, 1953; Breccia *et al.*, 1982; Boyer, 1986). Recently, these so called "high energy density materials" have attracted renewed attention in conjunction with their favorable detonation performance (Storm *et al.*, 1990; Katritzky *et al.*, 1993; Bulusu *et al.*, 1995). As a promising candidate, 1-methyl-4,5-dinitroimidazole was synthesized by the nitration of *N*-methyl-imidazole (Damavarapu *et al.*, 2007). Here we report the crystal structure of the title compound (Fig. 1).

In the crystal structure, the two nitro groups are twisted with respect to the imidazole plane, making dihedral angles of 24.2 (3)° (N3/O1, O2) and 33.4 (4)° (N4/O3, O4). The molecular packing (Fig. 2) is stabilized by non-classical intermolecular C–H···O hydrogen bonds; the first between the imidazole H atom and an oxygen of the nitro group, with C1–H1···Oⁱ, the second between the methyl H atom and an oxygen of the nitro group, with C4–H4A···O4ⁱⁱ, respectively (Table 1).

Experimental

The title compound was prepared according to literature method (Damavarapu *et al.*, 2007). Single crystals suitable for X-ray diffraction were obtained by evaporation of a solution of the title compound in methanol at room temperature.

Refinement

All the Friedel pairs were merged. All H atoms were positioned geometrically and treated as riding, with C–H bond lengths constrained to 0.93 ° for imidazole ring H and 0.96 ° for methyl H atoms, and with $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C})$ for imidazole ring H atom and $1.5U_{\text{eq}}(\text{C})$ for methyl H atoms.

Figures

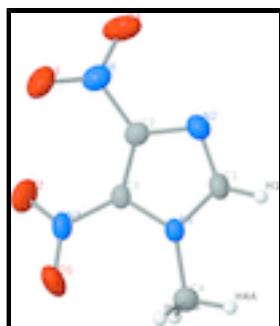

Fig. 1. The molecular structure of the title compound with the atom numbering scheme. Displacement ellipsoids are drawn at the 30% probability level. H atoms are presented as small spheres of arbitrary radius.

supplementary materials

	$\Delta\rho_{\text{min}} = -0.18 \text{ e \AA}^{-3}$

1 restraint

Extinction correction: SHELXL97 (Sheldrick, 2008),
 $F_c^* = k F_c [1 + 0.001 x F_c^2 \lambda^3 / \sin(2\theta)]^{1/4}$

Primary atom site location: structure-invariant direct methods

Extinction coefficient: 0.147 (18)

Special details

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R-factor wR and goodness of fit S are based on F^2 , conventional R-factors R are based on F, with F set to zero for negative F^2 . The threshold expression of $F^2 > 2\text{sigma}(F^2)$ is used only for calculating R-factors(gt) etc. and is not relevant to the choice of reflections for refinement. R-factors based on F^2 are statistically about twice as large as those based on F, and R- factors based on ALL data will be even larger.
