Received 22 November 2009; accepted 23 November 2009

Key indicators: single-crystal X-ray study; $T = 120\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.003\text{ \AA}$; R factor = 0.040; wR factor = 0.109; data-to-parameter ratio = 11.3.

The title hydrate, $\text{C}_{10}\text{H}_{10}\text{N}_4\cdot\text{H}_2\text{O}$, shows a small twist in the hydrozone derivative, the dihedral angle between the pyridine and pyrrole rings being $11.08(12)^\circ$. The pyridine and pyrrole N atoms lie to the same side of the molecule being sustained in place by hydrogen-bonding interactions with the water molecule. Further intermolecular O—H···N and N—H···O hydrogen bonding leads to the formation of supramolecular arrays in the *ab* plane.

2-[*(E*)-(1*H*-Pyrrol-2-ylmethylidene)hydrazinyl]pyridine monohydrate

G. M. de Lima, E. R. T. Tiekink, J. L. Wardell and S. M. S. V. Wardell

Comment

In continuation of studies into the supramolecular arrangements of hydrazone (Baddeley *et al.*, 2009; Wardell, Skakle *et al.*, 2007; Wardell, Low *et al.*, 2007; Ferguson *et al.*, 2005), we now report the structure of the title hydrate, (I).

The molecule of (I), Fig. 1, is non-planar owing to a twist about the C6–C7 bond as seen in the C3–C6–C7–N4 torsion angle of -11.2 (3)°. The dihedral angle between the pyrrole and pyridine rings is 11.08 (12)°. The conformation about the C6=N3 bond is E and the pyrrole- and pyridine-N atoms are *syn*. This arrangement is stabilized by pyrrole-NH···O_{water} and water-OH···N_{pyridine} hydrogen bonds, Fig. 1 and Table 1.

The water molecule also plays a pivotal role in stabilizing the crystal structure, forming additional donor and acceptor interactions to link three distinct molecules. The molecules stack into columns aligned along the *a* axis and alternate between organic and water molecules along the *b* axis, Fig. 2 and Table 1. The resultant layers stack along the *c* axis, Fig. 3.

Experimental

A solution of 2-hydrazinopyridine (0.330 g, 3 mmol) in MeOH (15 ml) was added to a solution of 2-pyrrolcarboxaldehyde (0.270 g, 3 mmol) in MeOH (10 ml). The reaction mixture was refluxed for 20 min, and maintained at room temperature. The crystals which slowly formed were collected and recrystallized twice from MeOH. *M. pt.* 449 - 452 K. IR(KBr, cm⁻¹): ν 1603(C=N). Anal. Found, C, 59.13; H, 5.81; N, 27.71. Calc. for C₁₀H₁₀N₄·H₂O: C, 58.82; H, 5.92; N, 27.43%

Refinement

The C-bound H atoms were geometrically placed (C–H = 0.95 Å) and refined as riding with $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C})$. The O- and N-bound H atoms were located from a difference map and included in their idealized positions with O–H = 0.84±0.01 and N–H = 0.88±0.01 Å, and with $U_{\text{iso}}(\text{H}) = nU_{\text{eq}}(\text{O}, \text{N})$; n = 1.5 for O and n = 1.2 for N. After analysis with PLATON (Spek, 2003), the structure was refined as a twin, with the twin component related by -1 0 0, 0 -1 0, 2 0 1, and with a fractional contribution of 0.4418 (23).

Figures

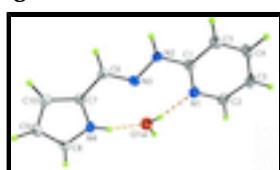

Fig. 1. The molecular structure of (I) showing the atom-labelling scheme and displacement ellipsoids at the 50% probability level. The O—H···N and N—H···O hydrogen bonds are shown as orange dashed lines.

supplementary materials

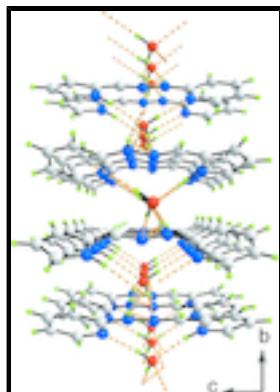

Fig. 2. A side-on view of a supramolecular layer in (I) showing O–H···N and N–H···O hydrogen bonding between the molecules (orange dashed lines). Colour code: O, red; N, blue; C, grey; and H, green.

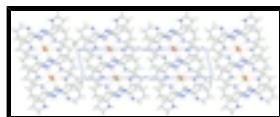

Fig. 3. A view in projection down the b axis showing the stacking of layers along the c axis in (I). The O–H···N and N–H···O hydrogen bonding is shown as orange dashed lines. Colour code: O, red; N, blue; C, grey; and H, green.

3068 measured reflections	

Refinement

Refinement on F^2	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.040$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.109$	H atoms treated by a mixture of independent and constrained refinement
$S = 1.07$	$w = 1/[\sigma^2(F_o^2) + (0.0651P)^2 + 0.3833P]$ where $P = (F_o^2 + 2F_c^2)/3$
1680 reflections	$(\Delta/\sigma)_{\max} < 0.001$
149 parameters	$\Delta\rho_{\max} = 0.19 \text{ e \AA}^{-3}$
4 restraints	$\Delta\rho_{\min} = -0.24 \text{ e \AA}^{-3}$

Special details

Geometry. All s.u.'s (except the s.u. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell s.u.'s are taken into account individually in the estimation of s.u.'s in distances, angles and torsion angles; correlations between s.u.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell s.u.'s is used for estimating s.u.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > 2\sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
