Received 19 November 2009; accepted 30 November 2009

Key indicators: single-crystal X-ray study;  $T = 298\text{ K}$ ; mean  $\sigma(\text{C}-\text{C}) = 0.007\text{ \AA}$ ;  $R$  factor = 0.049;  $wR$  factor = 0.132; data-to-parameter ratio = 13.0.

In the crystal structure of the mononuclear title complex,  $[\text{Ni}(\text{C}_{10}\text{H}_9\text{N}_2\text{O}_2)_2(\text{H}_2\text{O})]$ , the  $\text{Ni}^{II}$  ion is five-coordinated in a distorted square-pyramidal geometry by two N atoms and two O atoms from 2,3-dimethyl-4-oxopyrido[1,2-a]pyrimidin-9-olate ligands and one O atom from a water molecule. O—H···O hydrogen bonds between the coordinated water molecule and the ligand connect adjacent molecules, forming a ribbon parallel to the  $b$  axis.

## Aquabis(2,3-dimethyl-4-oxo-4H-pyrido[1,2-a]pyrimidin-9-olato)nickel(II)

H. Zhang, Y. Sun, X. Chen, F. Yu and Z. Zou

### Comment

Considerable attention has been paid to the design and synthesis of complexes with organic ligands containing N and O donors (Wei *et al.*, 2009; Sun *et al.*, 2008; Bayot *et al.*, 2006; Chen, *et al.*, 2007). Quinolin-8-ol is one such ligand and several crystal structures of complexes containing it have been reported (Wu *et al.*, 2006). We report here the synthesis and crystal structure of the title complex (I) (Fig. 1). In (I), the Ni atom is five-coordinated by two pyridine nitrogen atoms and two oxygen atoms from the hydroxy groups and one oxygen atom from a water molecule (Fig. 1). Intermolecular O—H···O hydrogen bonds (Fig. 2 and Table 1) connecting the molecules of (I) define the crystal packing.

### Experimental

All chemicals used (reagent grade) were commercially available. An aqueous solution (5 ml) of Ni(Ac)<sub>2</sub>·4H<sub>2</sub>O (24.9 mg, 0.1 mmol) was added to an ethanol solution (10 ml) containing 2,3-dimethyl-9-hydroxypyrido[1,2-a]pyrimidin-4-one (38.0 mg, 0.2 mmol) then filtered off. The resulting solution was continuously stirred for about 30 min and then filtered. The filtrate was slowly evaporated at room temperature over several days and colorless prism crystals suitable for X-ray analysis were obtained.

### Refinement

The H atoms bound to carbon were placed in geometrical positions and refined using a riding model, with C—H = 0.93 Å and U<sub>iso</sub>(H) = 1.2Ueq(C) for aromatic H atoms, and with C—H = 0.96 Å and U<sub>iso</sub>(H) = 1.5Ueq(C) for methyl H atoms. The H atoms of the coordinated water were located from the Fourier difference map and refined with a distance restraint of O—H = 0.85 Å.

### Figures

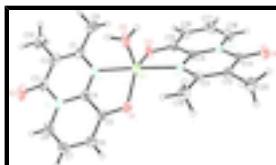

Fig. 1. The molecular structure of the title molecule and the atom-numbering scheme. Displacement ellipsoids are drawn at the 30% probability level.

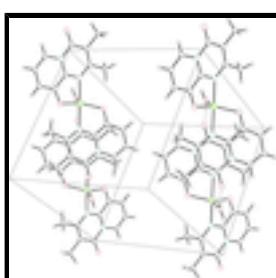

Fig. 2. Crystal packing of compound (I). Hydrogen bonds are shown as dashed lines.

### Refinement

Refinement on $F^2$	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.049$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.132$	H-atom parameters constrained
$S = 1.03$	$w = 1/[\sigma^2(F_o^2) + (0.0496P)^2 + 2.7285P]$ where $P = (F_o^2 + 2F_c^2)/3$
3520 reflections	$(\Delta/\sigma)_{\text{max}} = 0.001$
271 parameters	$\Delta\rho_{\text{max}} = 0.41 \text{ e \AA}^{-3}$
0 restraints	$\Delta\rho_{\text{min}} = -0.40 \text{ e \AA}^{-3}$

### Special details

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations

between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
