Received 13 November 2009; accepted 26 November 2009

Key indicators: single-crystal X-ray study; $T = 200\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.012\text{ \AA}$; R factor = 0.048; wR factor = 0.089; data-to-parameter ratio = 19.3.

The Au atom in the C_2 -symmetric pincer-type title complex, $[\text{AuCl}(\text{C}_{19}\text{H}_{23}\text{N}_5)]$, is in the +3 oxidation state. The ligand is composed of one pyridine unit and two *n*-butyl-substituted pyrazoles (pyrz). Both pyrazoles are deprotonated, thus forming a neutral compound. To the best of our knowledge, this is the first Au^{III} -bispyrazolate complex. According to the special geometry in the N,N',N'' -tridentate ligand, containing two five-membered heterocycles, the complex deviates from an ideal square-planar coordination geometry; the $\text{N}_{\text{pyrz}}-\text{Au}-\text{N}_{\text{pyrz}}$ angle is $160.8(3)^\circ$, indicating a distortion of nearly 20° .

Chlorido[3,3'-dibutyl-5,5'-(pyridine-2,6-diyl)dipyrazol-1-ido]gold(III)

A. S. K. Hashmi, C. Lothschütz and F. Rominger

Comment

Catalysis of organic reactions by gold complexes has become a very important area of research in the past decade (Hashmi & Hutchings, 2006a, 2006b; Hashmi, 2007). While the field is dominated by gold(I) complexes (Ito *et al.*, 1986), the use of gold(III) pre-catalysts is also of interest (Hashmi *et al.*, 2004a, 2004b). Here we report the structural details of a new representative of the gold(III) pre-catalysts. The main feature of this structure is the ring strain of the two 5-membered metallacycles that were built up by the pincer ligand and the gold center. The theoretical sum of the bond angles in these flat 5-membered metallacycles is 540.0°, as it was observed in both cases. For a hypothetic strain-free (ring-opened) molecule simple geometrical considerations result an angle sum of about 582° (90° at Au1, 120° at N1, C2, C6, and 126° at C11, N12 C21, N22). The required adaption of 42° is achieved by bending the bond angles (mean values over both rings) at Au1 (9.7°), N1 (2.4°), C2/C6 (7.6°), C11/C21 (10.3°), and N12/N22 (12.0°). As expected the bending at the pyridin nitrogen atom N1 is by far least, as the aromatic ring itself is rigid and cannot bend on two sides simultaneously.

Experimental

2,6-bis(5-butyl-1*H*-pyrazol-3-yl)pyridine (200 mg, μmol) was dissolved in acetone (5 ml). After this HAuCl₄*xH₂O (248 mg, 618 μmol , 49% metal content) in acetonitrile (3 ml) and NaOH (2.5 M in H₂O, 741 μl) were added consecutively. The mixture was warmed to 60 °C for 20 min, during this time the initially formed yellow precipitate dissolved. The mixture was subjected to hot filtration and the solvent was removed under reduced pressure. The crude complex was purified by recrystallization from acetone to yield the title compound as red crystals (96.0 mg, 173 μmol , 28%). The compound is stable at RT in air.

¹H NMR (300 MHz, acetone): δ =0.93 (t, J=7.3 Hz, 6H, CH₃), 1.4 (dm, J=8.5, 7.1 Hz, 4H, CH₂), 1.65 (m, 4H, CH₂), 2.66 (t, J=7.5 Hz, 4H, CH₂), 7.71 (d, J=7.9 Hz, 2H, ArH), 8.25 (t, J=7.9 Hz, 1H, ArH); ¹³C NMR (75 MHz, acetone): δ = 14.27, 23.13, 32.87, 106.97, 116.38 (no further signals observed, one signal overlapping with solvent at about 29 p.p.m.)

Refinement

Carbon-bound H-atoms were placed in calculated positions (C–H 0.95–0.99 Å) and were included in the refinement in the riding model approximation with $U_{\text{iso}}(\text{H})$ set to 1.2–1.5 $U_{\text{eq}}(\text{C})$. A staggered group model was used for the methyl groups.

Refinement

Refinement on F^2	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.048$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.089$	H-atom parameters constrained
$S = 1.07$	$w = 1/[\sigma^2(F_o^2) + (0.0241P)^2 + 2.5681P]$ where $P = (F_o^2 + 2F_c^2)/3$
4539 reflections	$(\Delta/\sigma)_{\max} = 0.001$
235 parameters	$\Delta\rho_{\max} = 0.91 \text{ e } \text{\AA}^{-3}$
0 restraints	$\Delta\rho_{\min} = -1.01 \text{ e } \text{\AA}^{-3}$

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
