Received 30 November 2009; accepted 14 December 2009

Key indicators: single-crystal X-ray study; $T = 100$ K; mean $\sigma(C-C) = 0.009 \text{ \AA}$; R factor = 0.043; wR factor = 0.092; data-to-parameter ratio = 21.5.

The asymmetric unit of the title *triangulo*-triruthenium compound, $2[Ru_3(C_{25}H_{22}As_2)(C_{18}H_{12}Cl_3P)(CO)_9]\cdot CHCl_3$, consists of two molecules (*A* and *B*) of the *triangulo*-triruthenium complex and one molecule of chloroform solvent. The bis(diphenylarsino)methane ligand bridges an Ru–Ru bond and the monodentate phosphine ligand bonds to the third Ru atom. Both the phosphine and arsine ligands are equatorial with respect to the Ru₃ triangle. In addition, each Ru atom carries one equatorial and two axial terminal carbonyl ligands. The three phosphine-substituted benzene rings make dihedral angles of 73.5 (3), 57.2 (3) and 75.7 (3) $^\circ$ with each other in molecule *A*, while these angles are 60.7 (3), 86.8 (3) and 54.9 (3) $^\circ$ in molecule *B*. The dihedral angles between the two benzene rings are 87.3 (3) and 89.6 (3) $^\circ$ for the two diphenylarsino groups in molecule *A* and 85.6 (3) and 87.7 (3) $^\circ$ in molecule *B*. In the crystal packing, the molecules are linked into a three-dimensional framework *via* intermolecular C–H \cdots O and C–H \cdots Cl hydrogen bonds. Weak intermolecular C–H \cdots π interactions further stabilize the crystal structure. The crystal studied was an inversion twin, the refined ratio of twin components being 0.480 (7):0.520 (7).

Comment

Triangulo-triruthenium clusters are known for their interesting structural variations and related catalytic activity. A large number of substituted derivatives, Ru₃(CO)_{12-n}L_n (*L* = group 15 ligand) have been reported (Bruce *et al.*, 1985, 1988*a,b*). As part of our study on the substitution of transition metal-carbonyl clusters with mixed-ligand complexes, we have published several structures of *triangulo*-triruthenium-carbonyl clusters containing mixed P/As and P/Sb ligands (Shawkataly *et al.*, 1998, 2004, 2009). Herein we report the synthesis and structure of title compound.

The asymmetry unit consists of two molecules of *triangulo*-triruthenium complex (*A* and *B*) and one molecule of chloroform solvent (Fig. 1). The bond lengths and angles of title compound are comparable to its related structure (Shawkataly *et al.*, 2009). The bis(diphenylarsino)methane ligand bridges the Ru1—Ru2 bond and the monodentate phosphine ligand bonds to the Ru3 atom. Both the phosphine and arsine ligands are equatorial with respect to the Ru₃ triangle. Additionally, each Ru atom carries one equatorial and two axial terminal carbonyl ligands. The three phosphine-substituted benzene rings make dihedral angles (C26—C31/C32—C37, C26—C31/C38—C43 and C32—C37/C38—C43) of 73.5 (3), 57.2 (3) and 75.7 (3)° with each other in molecule *A* whereas these angles are 60.7 (3), 86.8 (3) and 54.9 (3)° in molecule *B*. The dihedral angles between the two benzene rings (C1—C6/C7—C12 and C14—C19/C20—C25) are 87.3 (3) and 89.6 (3)° for the two diphenylarsino groups in molecule *A* whereas these angles are 85.6 (3) and 87.7 (3)° in molecule *B*. In the crystal packing, the molecules are linked together into three-dimensional framework *via* intermolecular C5B—H5BA···O4B, C40B—H40B···O3A and C23B—H23B···Cl1B hydrogen bonds (Fig 2). Weak intermolecular C—H···π interactions further stabilize the crystal structure (Table 1).

Experimental

All manipulations were performed under a dry oxygen-free dinitrogen atmosphere using standard Schlenk techniques, all solvents were dried over sodium and distilled from sodium benzophenone ketyl under nitrogen. Tris(4-chlorophenyl)diphenylphosphine (Maybridge) was used as received and bis(diphenylarsino)methanecacarbonyltriruthenium(0) (Bruce *et al.*, 1983) was prepared by a reported procedure. The title compound was obtained by refluxing equimolar quantities of Ru₃(CO)₁₀(μ -Ph₂AsCH₂AsPh₂) (105.5 mg, 0.1 mmol) and tris(4-chlorophenyl)phosphine (36.56 mg, 0.1 mmol) in hexane under a nitrogen atmosphere. Crystals suitable for X-ray diffraction were grown by slow solvent / solvent diffusion of C₆H₁₄ into CH₂Cl₂.

Refinement

All hydrogen atoms were positioned geometrically and refined using a riding model with C—H = 0.93–0.97 Å and *U*_{iso}(H) = 1.2 *U*_{eq}(C). The crystal studied is an inversion twin with the refined ratio of twin components being 0.480 (7):0.520 (7).

Special details

Experimental. The crystal was placed in the cold stream of an Oxford Cyrosystems Cobra open-flow nitrogen cryostat (Cosier & Glazer, 1986) operating at 100.0 (1) K.

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.

Hydrogen-bond geometry (\AA , $^\circ$)

Cg1 Cg2 and Cg3 are the centroids of the C14A–C19A, C20B–C25B and C1A–C6A benzene rings, respectively.

$D\text{--H}\cdots A$	$D\text{--H}$	$H\cdots A$	$D\cdots A$	$D\text{--H}\cdots A$
