Received 1 December 2009; accepted 2 December 2009

Key indicators: single-crystal X-ray study; $T = 93\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.002\text{ \AA}$; R factor = 0.036; wR factor = 0.094; data-to-parameter ratio = 18.6.

In the title salt hydrate, $\text{C}_{22}\text{H}_{30}\text{N}_2\text{O}_6^{2+} \cdot 2\text{Cl}^- \cdot \text{CH}_4\text{O}$, the dication adopts a U-shaped conformation whereby the benzene rings are splayed out from the chain linking them. All components of the asymmetric unit are linked into a cohesive entity by a combination of $\text{O}-\text{H}\cdots\text{Cl}^-$, $\text{N}^+-\text{H}\cdots\text{Cl}^-$ and $\text{N}^+-\text{H}\cdots\text{O}$ charge-assisted hydrogen-bonding interactions. The assemblies thus formed are linked into supramolecular helical chains along [010] via $\text{C}-\text{H}\cdots\text{O}$ contacts. The resulting chains are, in turn, consolidated into the three-dimensional crystal structure by $\text{C}-\text{H}\cdots\pi$ contacts.

1,12-Bis(2-carboxyphenyl)-5,8-dioxa-2,11-diazadodecane-2,11-diium dichloride methanol solvate

S. Johnson, G. T. Musie and E. R. T. Tiekink

Comment

Since the concept of dinucleating ligands was developed (*e.g.* Fenton & Okawa, 1997; Uhlenbrock & Krebs, 1992; Koga *et al.*, 1998), various dinucleating ligands that stabilize dinuclear metal complexes have been reported in the literature (*e.g.* Ghiladi *et al.*, 1997; Kitagawa *et al.* 2004). Such ligands have also attracted attention in supramolecular and materials chemistry owing to their variety of structural topologies and potential applications in the rational design of metal-organic frameworks (Bradshaw *et al.*, 2005). Motivated by the above, the title compound, (I), was prepared as part of a on-going study aimed at developing this chemistry.

The crystallographic asymmetric unit of (I) comprises a 1,12-bis(2-carboxyphenyl)-5,8-dioxa-2,11-diazadodecane-2,11-diium dianion, two chloride anions, and a methanol molecule of solvation, Fig. 1. The central atoms, *i.e.* O3, O4, N1, N2 and C9–C14, define an approximate plane (r.m.s. for the fitted atoms = 0.239 Å), even allowing for the fact that the plane comprises only sp^3 atoms. The C8 and C15 atoms lie 0.5197 (17) and 0.3720 (17) Å to either side of this plane, indicating that the benzene rings also lie above and below the central plane. The orientations of the benzene rings are orthogonal to the central plane which forms dihedral angles with the C2–C7 and C16–C21 benzene rings of 89.20 (4) and 86.67 (4) °, respectively. The benzene rings have similar orientations with respect to the central plane and form a dihedral angle of 20.17 (3) ° to each other. Overall, the conformation of the molecule is U-shaped with the benzene rings splayed out to either side as illustrated in Fig. 2.

As indicated in Figs 1 and 2, there are a large number of hydrogen bonding interactions in the structure, and these occur between species comprising the asymmetric unit, Table 1. Each of the carboxylic acid groups as well as the hydroxyl group of the solvent molecule forms a charge-assisted O–H···Cl[−] hydrogen bond, Fig. 1. The ammonium groups behave similarly to each other in terms of forming hydrogen bonding interactions. The N1—H1a atom forms disparate N⁺–H···O hydrogen bonds with two carbonyl-O atoms, Fig. 2, and the H1b atom forms a charge-assisted N⁺–H···Cl[−] hydrogen bond, Fig. 1. In the case of N1–H1b, the shorter N⁺–H···O interaction is formed with the carbonyl-O5 atom and the weaker contact is made with the ester-O4 atom, Fig. 2. The hydrogen bonding thus far described provides stability to the asymmetric unit.

The most prominent interactions linking the asymmetric units are of the type C–H···O, Table 1. These involve the solvent methanol molecule which in turn is connected to both the Cl1 anion and the carboxylic acid-O2 atom of a second cation. In this fashion a supramolecular helical chain is formed along [0 1 0], Fig. 3. Fig. 3 clearly illustrates the differences between the chlorides in that the Cl1[−] anion forms three significant hydrogen bonding contacts and the Cl2[−] atom only forms two. The supramolecular chains are consolidated into the crystal structure *via* C–H···π interactions, Fig. 4 and Table 1. These occur between methylene-C8–H8b and the ring centroid, Cg, of the C16–C21 ring so that H8b···Cg^j = 2.88 Å, C8···Cg^j = 3.6364 (16) Å with an angle of 134 ° subtended at the H8b atom, for symmetry operation i: 1 - x, 1 - y, 1 - z.

supplementary materials

Experimental

In a 200 ml round bottom flask, 2-carboxybenzaldehyde (4.0424 g, 0.027 mol) was dissolved in methanol (30 ml). While stirring at 308 K, sodium hydroxide (1.0754 g, 0.027 mol) was added. In a separate flask, 2,2'-(ethylenedioxy)bis(ethylamine) (NOON) (1.951 ml, 1.98 g, 0.013 mol) was dissolved in methanol (10 ml). The NOON solution was added drop-wise into the original solution using a pipette. The reaction was left to react for 2.5 h. NaBH₄ (2.4296 g, 0.0643 mol) was then added to the flask in small portions. The resultant mixture was heated and stirred for another 2.5 h. It was then cooled in an ice bath and filtered to remove any solid. To the filtrate, concentrated HCl was added drop wise until the pH was about 2–3. A white precipitate was formed and filtered using gravity filtration. The white product was washed with acetone three times to remove any impurity and was dried. ¹H NMR (D₂O): δ 8.17 (s, 1H, aldamine-H), 7.75 (d, 2H, Ar—H), 7.60 (d, 2H, Ar—H), 7.41 (t, 2H, Ar—H), 7.36 (t, 2H, Ar—H), 3.87 (t, 2H, al-H), 3.75 (s, 2H, al-H), 3.45 (t, 2H, al-H) p.p.m.

Single crystals were obtained by slow evaporation of an acidic (1M HCl) aqueous solution of (I).

Refinement

The N- and C-bound H atoms were geometrically placed (N—H = 0.92 Å and C—H = 0.95–0.99 Å) and refined as riding with $U_{\text{iso}}(\text{H}) = 1.2\text{--}1.5U_{\text{eq}}(\text{C})$. The O—H hydrogen atoms were located from a difference map and refined with O—H = 0.84 (1) Å, and with $U_{\text{iso}}(\text{H}) = 1.5U_{\text{eq}}(\text{O})$.

Figures

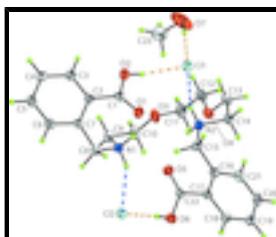

Fig. 1. Molecular structure of the asymmetric unit in (I), showing atom-labelling scheme and displacement ellipsoids at the 50% probability level. The O—H···Cl[−] and N⁺—H···Cl[−] interactions are shown as orange and blue dashed lines, respectively.

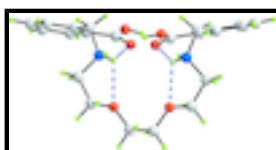

Fig. 2. A view of the dication in (I) highlighting the U-shaped geometry and the N⁺—H···O hydrogen bonds (blue dashed lines). Color code: Cl, cyan; O, red; N, blue; C, grey; and H, green.

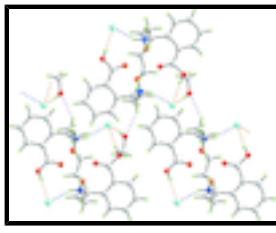

Fig. 3. The supramolecular chains in (I) aligned along [0 1 0]. The O—H···Cl[−] and N⁺—H···Cl[−] hydrogen bonds are shown as orange and blue dashed lines, respectively. The C—H···O contacts are shown as pink dashed lines. Color code: Cl, cyan; O, red; N, blue; C, grey; and H, green.

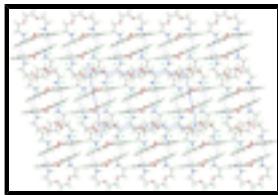

Fig. 4. A view in projection down the b axis in (I) highlighting the connections between supramolecular chains along [0 1 0]. The C–H \cdots π interactions are represented by purple dashed lines. Color code: Cl, cyan; O, red; N, blue; C, grey; and H, green.

Refinement

Refinement on F^2	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.036$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.094$	H-atom parameters constrained
$S = 1.05$	$w = 1/[\sigma^2(F_o^2) + (0.0485P)^2 + 1.3403P]$
5874 reflections	where $P = (F_o^2 + 2F_c^2)/3$
316 parameters	$(\Delta/\sigma)_{\max} = 0.001$
3 restraints	$\Delta\rho_{\max} = 0.51 \text{ e \AA}^{-3}$
	$\Delta\rho_{\min} = -0.34 \text{ e \AA}^{-3}$

supplementary materials

Special details

Geometry. All s.u.'s (except the s.u. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell s.u.'s are taken into account individually in the estimation of s.u.'s in distances, angles and torsion angles; correlations between s.u.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell s.u.'s is used for estimating s.u.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > 2\sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
