Received 7 December 2009; accepted 11 December 2009

Key indicators: single-crystal X-ray study;  $T = 200\text{ K}$ ; mean  $\sigma(\text{C}-\text{C}) = 0.002\text{ \AA}$ ;  $R$  factor = 0.031;  $wR$  factor = 0.086; data-to-parameter ratio = 27.3.

In the title compound,  $\text{C}_{15}\text{H}_{12}\text{Cl}_4\text{O}$ , the dihedral angle between the least-squares planes of the two benzene rings is  $82.6(9)^\circ$ . The dihedral angles between the COC mean plane of the oxy group and the two benzene rings are  $84.3(5)$  and  $10.8(5)^\circ$ . In the crystal, two weak  $\pi-\pi$  interactions [centroid-centroid distances =  $3.9989(8)$  and  $3.7912(8)\text{ \AA}$ ] and a  $\text{C}-\text{H} \cdots \pi$  interaction are observed.

## 2,4-Dichloro-1-[1-(2,4-dichlorobenzyloxy)ethyl]benzene

J. P. Jasinski, R. J. Butcher, C. S. Chidan Kumar, H. S. Yathirajan and B. Narayana

### Comment

Ether is a class of chemical compounds which contain an ether group — an oxygen atom connected to two (substituted) alkyl or aryl groups — of general formula  $R-O-R'$ . Ethers, with their characteristic solvation abilities, excel as inert reaction media in numerous synthetic procedures. However, in practice this usefulness is often tempered by an unfortunate proclivity to facile air oxidation at ambient temperatures which leads to peroxide formation. The structures of the few related compounds *viz.*, 4-(benzyloxy)-2-fluorobenzonitrile (Yan *et al.*, 2007), 2-benzyloxy-3-nitropyridine (Cui *et al.*, 2005), 2,6-bis[2-(4-benzyloxyphenyl)ethyl]biphenyl (Moratti *et al.*, 2007), 3-*tert*-butyl-4-methyl-2-phenyl-3-(trimethylsilyloxy)oxetane and 2-(2-benzyloxyphenyl)-3-*tert*-butyl-3-(trimethylsilyloxy)oxetane (Kotila *et al.*, 1996), bis-lactim ethers of cyclic dipeptides: Compounds derived from *cyclo*(Gly-L-Val) (Bolte *et al.*, 1999) and 5-benzyloxy-1-phenyltetrazole: catalytic transfer hydrogenolysis of benzyl ethers (Brigas *et al.*, 1999) are already reported. In view of the importance of ethers, the synthesis and crystal structure of the title compound, (I), is reported.

In the title compound,  $C_{15}H_{12}Cl_4O$ , (I), the dihedral angle between the least squares planes of the two benzene rings is  $82.6(9)^\circ$  (Fig. 1). The angle between the mean planes of the oxy group and the two benzene rings is  $84.3(5)^\circ$  and  $10.8(5)^\circ$ , respectively. Each of the two dichloro benzene rings are stacked diagonally along the (011) plane (Fig. 2). While no classic hydrogen bonds are found, weak  $\pi-\pi$  [ $Cg1 \cdots Cg1 = 3.9989(8)$  Å;  $1-x, 2-y, 1-z$  and  $Cg2 \cdots Cg2 = 3.7912(8)$  Å;  $2-x, 1-y, 2-z$ ] and  $C-H \cdots \pi$  [ $C12-H12A \cdots Cg1$ ; Table 1] intermolecular interactions are observed. Bond length and bond angles are within normal ranges (Allen, 2002).

Following geometry optimization using AM1 with MOPAC (Schmidt & Polik, 2007) and density functional theory (DFT) theoretical calculations (Schmidt & Polik, 2007) at the B3LYP/6-31G(*d*) level (Becke, 1988, 1993; Lee *et al.*, 1988; Hehre *et al.*, 1986) with the Gaussian03 program package (Frisch *et al.*, 2004), the dihedral angle between the least squares planes of the two benzene rings becomes  $83.6(3)^\circ$  (AM1) or  $85.9(6)^\circ$  (DFT). The angles between the mean planes of the oxy group and the two benzene rings become  $86.4(2)$  and  $3.5(6)^\circ$  (AM1) or  $88.6(5)$  and  $5.5(3)^\circ$  (DFT), respectively. It is clear that the weak  $\pi-\pi$  and  $C-H \cdots \pi$  intermolecular interactions do influence crystal packing stability.

### Experimental

A mixture of 1-(2,4-dichlorophenyl)ethanol (0.01 mol, 1.91 g) and 2,4-dichloro-1-(chloromethyl)benzene (0.01 mol, 1.95 g) in 30 ml dry acetone was refluxed over water bath for 6 h (Fig. 3). The crude compound was filtered and recrystallized from ethyl acetate (m.p. 449–451 K). Composition for  $C_{15}H_{12}Cl_4O$ : C 51.39 (51.46), H 3.42 (3.46).

### Refinement

All of the C-bonded H atoms were placed in their calculated positions and then refined using the riding model with  $C-H = 0.95$  to  $1.00$  Å, and with  $U_{\text{iso}}(\text{H}) = 1.18$ – $1.49 U_{\text{eq}}(\text{C})$ . The methyl group was allowed to rotate about the C—C bond.

### Crystal data

C <sub>15</sub> H <sub>12</sub> Cl <sub>4</sub> O	Z = 2
M <sub>r</sub> = 350.05	F(000) = 356
Triclinic, P $\bar{1}$	D <sub>x</sub> = 1.533 Mg m <sup>-3</sup>
Hall symbol: -P 1	Mo K $\alpha$ radiation, $\lambda$ = 0.71073 Å
$a$ = 9.3755 (4) Å	Cell parameters from 5527 reflections
$b$ = 9.9229 (4) Å	$\theta$ = 4.7–32.4°
$c$ = 9.9667 (4) Å	$\mu$ = 0.77 mm <sup>-1</sup>
$\alpha$ = 62.313 (3)°	T = 200 K
$\beta$ = 70.246 (4)°	Chunk, colorless
$\gamma$ = 71.467 (4)°	0.47 × 0.42 × 0.27 mm
$V$ = 758.22 (5) Å <sup>3</sup>	

### Data collection

Oxford Diffraction Gemini	4961 independent reflections
diffractometer	
Radiation source: fine-focus sealed tube	3334 reflections with $I > 2\sigma(I)$
graphite	$R_{\text{int}} = 0.015$

Detector resolution: 10.5081 pixels mm<sup>-1</sup>  
 $\varphi$  and  $\omega$  scans     $\theta_{\max} = 32.5^\circ$ ,  $\theta_{\min} = 4.7^\circ$   
 Absorption correction: multi-scan  
*(CrysAlis RED; Oxford Diffraction, 2007)*     $h = -13 \rightarrow 14$   
 $T_{\min} = 0.638$ ,  $T_{\max} = 0.812$      $k = -14 \rightarrow 14$   
 10547 measured reflections     $l = -14 \rightarrow 14$

### Refinement

Refinement on $F^2$	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.031$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.086$	H-atom parameters constrained
$S = 1.02$	$w = 1/[\sigma^2(F_o^2) + (0.0476P)^2]$ where $P = (F_o^2 + 2F_c^2)/3$
4961 reflections	$(\Delta/\sigma)_{\max} = 0.001$
182 parameters	$\Delta\rho_{\max} = 0.34 \text{ e \AA}^{-3}$
0 restraints	$\Delta\rho_{\min} = -0.25 \text{ e \AA}^{-3}$

### Special details

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.

*Hydrogen-bond geometry (Å, °)*

Cg1 is the centroid of the C1—C6 ring.

<i>D</i> —H··· <i>A</i>	<i>D</i> —H	H··· <i>A</i>	<i>D</i> ··· <i>A</i>	<i>D</i> —H··· <i>A</i>
C12—H12A···Cg1 <sup>i</sup>	0.95	2.97	3.8888 (15)	162

Symmetry codes: (i)  $x, y-1, z+1$ .
