Key indicators: single-crystal X-ray study;  $T = 100\text{ K}$ ; mean  $\sigma(\text{C}-\text{C}) = 0.002\text{ \AA}$ ;  $R$  factor = 0.040;  $wR$  factor = 0.106; data-to-parameter ratio = 18.4.

The title compound,  $C_{26}H_{28}N_2O_9 \cdot 1.5H_2O$ , the product of an acid-catalysed Wagner–Meerwein skeletal rearrangement, crystallizes as a sesquihydrate with the O atom of one of the two independent water molecules occupying a special position on a twofold axis. The organic molecule comprises a fused pentacyclic system containing two five-membered rings (cyclopentane and tetrahydrofuran) and three six-membered rings (piperidinone, tetrahydropyridine and benzene). The five-membered rings have the usual envelope conformations, and the central six-membered piperidinone and tetrahydropyridine rings adopt boat and sofa conformations, respectively. In the crystal, there are three independent  $\text{O}—\text{H}\cdots\text{O}$  hydrogen bonds, which link the organic molecules and water molecules into complex two-tier layers parallel to (001). The layers are further linked into a three-dimensional framework by attractive intermolecular carbonyl–carbonyl interactions.

**Comment**

Acid catalyzed Wagner-Meerwein rearrangement of substituted 3,8-dioxatricyclo[3.2.1.0<sup>2,4</sup>]octanes (epoxy-7-oxabicyclo[2.2.1]heptenes) is used extensively in organic synthesis (Popp & McEwen, 1958; Hogeveen & Van Krutchten, 1979; Hanson, 1991). However, with the exception of our works (Zubkov *et al.* 2004; Zubkov *et al.* 2009; Gurbanov *et al.* 2009), only a few examples of the skeletal rearrangement for 7-oxabicyclo[2.2.1]heptenes condensed with nitrogen-rings are known to date (Jung & Street, 1985; Keay *et al.* 1989). In particular, Wagner-Meerwein rearrangement in isoindolo[2,1-a]quinolines series has not been studied yet. The present work is meant to cover this gap. Hereunder, we report a new diastereoselective approach to 7,8-bis(acetyloxy)-5-*R*-7,9-epoxycyclopenta[4,5]pyrido[1,2-*a*]quinolines using 2-furyltetrahydroquinolines, readily accessible by Povarov reaction, as starting compounds (Zubkov *et al.* (2007)).

The structure of methyl 7,8-bis(acetyloxy)-11-oxo-5-(*N*-pyrrolidonyl)-7,9-epoxycyclopenta[4,5]pyrido[1,2-*a*]quinoline-10-carboxylate (**I**) was established by X-ray diffraction study (Fig. 1). Compound (**I**) crystallizes as sesquihydrate, *i.e.*, C<sub>26</sub>H<sub>28</sub>N<sub>2</sub>O<sub>9</sub>.1.5H<sub>2</sub>O; one of the two independent water molecules occupies a special position on the twofold axis. Molecule of (**I**) comprises a fused pentacyclic system containing two five-membered rings (cyclopentane and tetrahydrofuran) and three six-membered rings (piperidinone, tetrahydropyridine and benzene). Both five-membered rings of the bicyclic fragment have usual *envelope* conformations, and the central six-membered piperidinone and tetrahydropyridine rings adopt the *boat* and *sofa* conformations, respectively. The nitrogen N12 atom has a trigonal-planar geometry (sum of the bond angles is 359.5°). The dihedral angle between the planes of the piperidinone (or rather "bottom of the boat" C6A, C7, C10A, C11 plane) and benzene is 38.81 (3)°. The two carboxylate substituents at the C7 and C8 carbon atoms are in the sterically unfavorable *syn*-periplanar configuration relative to the tetrahydrofuran ring. Such disposition is explained by the direction of the Wagner-Meerwein rearrangement.

The pyrrolidinone ligand and carboxylate substituent at the C10 atom are on the same side of the core pentacyclic framework. It is noteworthy that these fragments are engaged in the attractive intermolecular carbonyl-carbonyl interactions C13=O1···C17<sup>i</sup>=O3<sup>i</sup> and C19=O5···C11<sup>ii</sup>=O8<sup>ii</sup> [O1···C17<sup>i</sup> 2.947 (1) Å, O5···C11<sup>ii</sup> 2.993 (1) Å; symmetry codes: (i) -*x*, *y*, 1/2 - *z*; (ii) -*x*, 1 - *y*, 1 - *z*]. Carbonyl-carbonyl interactions of such type were investigated in substantial detail by Allen *et al.* (1998).

The molecule of (**I**) possesses eight asymmetric centers at the C5, C6A, C7, C7A, C8, C9, C10 and C10A atoms and can have potentially numerous diastereomers. The crystal of (**I**) is racemic and consists of enantiomeric pairs with the following relative configuration of the centers: *rac*-5*S*<sup>\*</sup>,6a*S*<sup>\*</sup>,7*R*<sup>\*</sup>,7a*R*<sup>\*</sup>,8*R*<sup>\*</sup>,9*S*<sup>\*</sup>,10*S*<sup>\*</sup>,10a*R*<sup>\*</sup>.

There are three independent H-bonds (Table 1), which link the molecules of (**I**) and water molecules into complex two-tier layers parallel to (001) (Fig. 2). The layers are linked further into three-dimensional framework by the above-mentioned attractive intermolecular carbonyl-carbonyl interactions.

## Experimental

Boron trifluoride etherate (0.3 ml, 2.4 mmol) was added to a solution of methyl ( $1aR^*,2R^*,3R^*,3aS^*,10R^*,11aR^*,11bR^*,11cR^*$ )-4-oxo-10-(2-oxopyrrolidin-1-yl)-1a,2,3,3a,4,11,11a,11c-octahydro-10H-2,11b-epoxyoxireno[6,7]isoindolo[2,1-*a*]quinoline-3-carboxylate (0.51 g, 1.2 mmol) in 15 ml of acetic anhydride. The mixture was stirred for 2 h at 296 K, then it was diluted with 100 ml of water and treated with a saturated solution of sodium carbonate until pH ~ 8–9. Organic products were extracted with chloroform (3 x 50 ml). The extract was dried ( $MgSO_4$ ), concentrated and purified by crystallization from hexane-ethyl acetate to give 0.41 g (0.8 mmol) of the polycycle (I) as colourless rhomboid-shaped blocks (Fig. 3). Yield is 67%. The single crystals of product (I) were obtained by slow crystallization from a mixture of 95% ethanol-DMF (yield 30%). *M.p.* = 460–462 K. ## Refinement

The hydrogen atoms of the solvate water molecules were located in the difference Fourier map; C-bound H atoms were placed geometrically (C—H 0.95 Å, 0.98 Å, 0.99 Å, and 1.00 Å for aromatic, methyl, methylene and methine H atoms respectively) and included in the refinement in riding motion approximation [ $U_{iso}(H) = 1.2U_{eq}(C)$  for non-methyl H atoms;  $U_{iso}(H) = 1.5U_{eq}$  of the carrying atom for methyl and O-bound H atoms].

## Special details

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
