Received 24 November 2009; accepted 15 December 2009

Key indicators: single-crystal X-ray study;  $T = 300$  K; mean  $\sigma(\text{C}-\text{C}) = 0.004$  Å;  $R$  factor = 0.044;  $wR$  factor = 0.151; data-to-parameter ratio = 17.2.

In the course of our studies of silicon-containing anticancer compounds, the title compound,  $\text{C}_{13}\text{H}_{17}\text{NO}_2\text{Si}$ , was synthesized. The geometrical parameters including the geometry about the Si atom are typical. The molecules form dimers *via* a weak  $\text{C}-\text{H}\cdots\text{O}$  interaction described by the graph set  $R_2^2(10)$ . The dimers are assembled in rows stacked in the crystallographic  $b$ -axis direction *via*  $\pi-\pi$  interactions with a 3.332 (3) Å separation between the rows.

## Related literature

For literature related to drug design see: Bains & Tacke (2003); Bikzhanova *et al.* (2007); Franz (2007); Franz *et al.* (2007); Gately & West (2007); Guzei, Spencer, Zakai & Lynch (2010); Guzei, Spencer & Zakai (2010); Lee *et al.* (1993, 1996); Sen & Roach (1995); Showell & Mills (2003); Tacke & Zilch (1986); Tsuge *et al.* (1985); Yoon *et al.* (1991, 1992, 1997). For a description of the Cambridge Structural Database, see: Allen (2002). Bond distances and angles were confirmed to be typical by a *Mogul* structural check (Bruno *et al.*, 2002). For graph-set notation, see: Grell *et al.* (1999).

## Experimental

## Crystal data

$\text{C}_{13}\text{H}_{17}\text{NO}_2\text{Si}$	$V = 1435.5 (10) \text{ \AA}^3$
$M_r = 247.37$	$Z = 4$
Monoclinic, $P2_1/n$	Mo $K\alpha$ radiation
$a = 11.562 (5) \text{ \AA}$	$\mu = 0.16 \text{ mm}^{-1}$
$b = 6.411 (2) \text{ \AA}$	$T = 300 \text{ K}$
$c = 19.445 (8) \text{ \AA}$	$0.89 \times 0.40 \times 0.30 \text{ mm}$
$\beta = 95.176 (14)^\circ$	

## Data collection

Bruker SMART X2S diffractometer	9164 measured reflections
Absorption correction: multi-scan ( <i>SADABS</i> ; Bruker, 2009)	2701 independent reflections
$T_{\min} = 0.875$ , $T_{\max} = 0.955$	1750 reflections with $I > 2\sigma(I)$
	$R_{\text{int}} = 0.036$

## Refinement

$R[F^2 > 2\sigma(F^2)] = 0.044$	157 parameters
$wR(F^2) = 0.151$	H-atom parameters constrained
$S = 0.99$	$\Delta\rho_{\text{max}} = 0.15 \text{ e \AA}^{-3}$
2701 reflections	$\Delta\rho_{\text{min}} = -0.16 \text{ e \AA}^{-3}$

Table 1

Hydrogen-bond geometry (Å, °).

## 2-[2-(Trimethylsilyl)ethyl]isoindoline-1,3-dione

I. A. Guzei, L. C. Spencer and U. I. Zakai

### Comment

Sila phthalimides are important intermediates in photochemistry (Lee *et al.*, 1993, 1996; Yoon *et al.*, 1997, 1992, 1991) and organic synthesis (Bikzhanova *et al.*, 2007; Tsuge *et al.*, 1985). We have used methods of organosilicon chemistry (Franz, 2007; Franz *et al.*, 2007; Gately & West, 2007; Tacke & Zilch, 1986; Showell & Mills, 2003) to prepare an array of substituted sila amines (Bikzhanova *et al.*, 2007) and to fine-tune the properties of pharmacological drugs (Bains & Tacke, 2003). Sila phthalimides can be obtained from the respective chlorosilanes (Tsuge *et al.*, 1985) or from alcohols by means of the Misunubu reaction (Sen & Roach, 1995) as in the present case. During our research toward silicon-containing anti-cancer drugs the title compound, (I), was isolated and characterized.

The bond distances and angles of (I) are typical as confirmed by the *Mogul* structural check (Bruno *et al.*, 2002), and agree well with those for the related compounds 2-(3-(methyl-diphenylsilyl)propyl)isoindoline-1,3-dione (Guzei, Spencer, Zakai & Lynch, 2010) and 2-(((4-methoxyphenyl)dimethylsilyl)methyl)isoindoline-1,3-dione (Guzei, Spencer & Zakai, 2010). Specifically, the average Si—C distances of 1.867 (3) Å for compound (I) are statistically similar to the 1.88 (3) Å average for 83 related compounds in the Cambridge Structural Database (Version 1.11, September 2009 release; Allen, 2002). The Si atom has a distorted tetrahedral geometry with angles ranging from 107.87 (11)° to 110.45 (11)°. The phthalate entity is expectedly planar within 0.0083 Å.

The molecules form dimers *via* a weak C11—H11...O2 interaction with a distance of 3.443 (4) Å and an angle of 155°. The pattern formed can be described in graph set notation as  $R_2^2(10)$  (Grell *et al.*, 1999). The dimers are assembled into rows *via* weak  $\pi$ - $\pi$  interactions with a distance of 3.366 (5) Å between atoms C13 in separate dimers. The rows are stacked in the crystallographic *b* direction.

### Experimental

The title compound was obtained *via* a Mitsunubu reaction as described by Sen and co-workers (Sen & Roach, 1995). To a pre-dried 100 ml round bottom flask was added 2-(trimethylsilyl)ethanol (319 mg, 2.7 mmol). Additionally, potassium phthalimide (512 mg, 3.48 mmol) and triphenyl phosphine (913, 3.48 mmol) were added to the reaction flask. The flask was sealed with a rubber septum, evacuated, and then filled with an inert atmosphere (nitrogen). Subsequently, 30 ml of freshly distilled THF was added to the round bottom flask. In the dark, the flask was then wrapped with aluminium foil and diisopropyl azodicarboxylate (DIAD) was slowly syringed into the reaction flask. This mixture was allowed to stir at room temperature for four hours. Three ml of water was slowly injected into the reaction mixture, and the given suspension was allowed to stir for a few more minutes. The aluminium foil covering the reaction flask was removed and its contents were poured into an extraction flask. The aqueous phase was extracted 3–5 times with hexane and the resultant organic extracts were dried with MgSO<sub>4</sub> and filtered. The filtrate was mixed with silica gel and this slurry was dried under reduced pressure. The dry powder was loaded onto a pre-dry packed silica gel column and eluted with a gradient column. The desired material was collected using a 8:2 hexane:ethyl acetate mixture. The compound of interest was dried under reduced

## supplementary materials

pressure and recrystallized from dichloromethane to afford lustrous white needles (0.35 g, 1.41 mmol, 52% yield) for X-ray crystallography. Manipulation of air and moisture sensitive compounds was performed using standard high-vacuum line techniques. All solvents and reagents were obtained from Aldrich. 2-(trimethylsilyl)ethanol was purchased from Gelest.  $^1\text{H}$  NMR spectra were obtained on a Varian Unity 500 spectrometer,  $^{13}\text{C}$  {H} NMR spectra were obtained on a Varian 500 spectrometer operating at 125 MHz,  $^{29}\text{Si}$  {H} NMR spectra were obtained on a Varian Unity spectrometer operating at 99 MHz. EI Mass spectra were determined on a Waters (Micromass) AutoSpec mass spectrometer. Melting points were determined on a Mel-Temp Laboratory Device. mp: 48–50°;  $^1\text{H}$  NMR (500 MHz,  $\text{CDCl}_3$ )  $\delta$  0.04 (s, 9H,  $\text{Si}(\text{Me}_3)_3$ ), 0.98 (m, 2H,  $\text{CH}_2$ ), 3.69 (m, 2H,  $\text{CH}_2$ ), 7.66 (dd,  $J=5.48$ , 3.01 Hz, 2H, ArH), 7.79 (dd,  $J=5.42$ , 3.06 Hz, 2H, ArH);  $^{13}\text{C}$  NMR (125 MHz,  $\text{CDCl}_3$ )  $\delta$  -1.8 (SiMe), 17.0 ( $\text{CH}_2$ ), 34.4 ( $\text{CH}_2$ ), 123.0 (CH), 132.3 (CH), 133.7 (CH), 168.2 (CO);  $^{29}\text{Si}$  NMR (99 MHz,  $\text{CDCl}_3$ ) 0.01 ( $\text{Si}(\text{Me}_3)_3$ ); MS ( $\text{EI}^+$ )  $m/z$  (*rel.* intensity %) 247 ( $M^+$ , 23), 246 ( $M-1$ , 100), 232 (50), 204 (75), 160 (26), 130 (55), 91 (49), 73 (39); HRMS ( $\text{EI}^+$ ): calcd. for  $\text{C}_{13}\text{H}_{17}\text{NO}_2\text{Si}$  ( $M^+$ ) 247.1024, found ( $M-1$ ) $^+$  246.0945.

### Refinement

All H-atoms were placed in idealized locations and refined as riding with appropriate thermal displacement coefficients  $U_{\text{iso}}(\text{H}) = 1.2$  or 1.5 times  $U_{\text{eq}}(\text{bearing atom})$ . The data were collected at room temperature on a Bruker SMART X2S diffractometer in the automated mode and manually processed thereafter.

### Figures

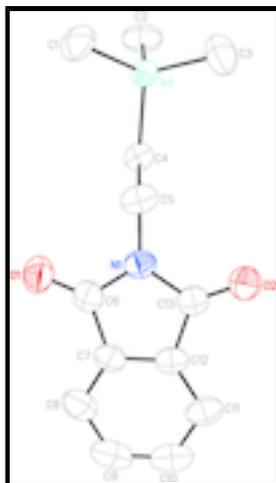

Fig. 1. Molecular structure of (I). The thermal ellipsoids are shown at 30% probability level.

### Data collection

Bruker SMART X2S diffractometer  
 Radiation source: micro-focus sealed tube  
 doubly curved silicon crystal  
 $\omega$  scans  
 Absorption correction: multi-scan (SADABS; Bruker, 2009)  
 $T_{\min} = 0.875$ ,  $T_{\max} = 0.955$   
 9164 measured reflections

2701 independent reflections  
 1750 reflections with  $I > 2\sigma(I)$   
 $R_{\text{int}} = 0.036$   
 $\theta_{\max} = 25.7^\circ$ ,  $\theta_{\min} = 3.4^\circ$   
 $h = -14 \rightarrow 14$   
 $k = -7 \rightarrow 7$   
 $l = -23 \rightarrow 23$

### Refinement

Refinement on  $F^2$   
 Least-squares matrix: full  
 $R[F^2 > 2\sigma(F^2)] = 0.044$   
 $wR(F^2) = 0.151$   
 $S = 0.99$   
 2701 reflections  
 157 parameters  
 0 restraints

Primary atom site location: structure-invariant direct methods  
 Secondary atom site location: difference Fourier map  
 Hydrogen site location: inferred from neighbouring sites  
 H-atom parameters constrained  
 $w = 1/[\sigma^2(F_o^2) + (0.0922P)^2 + 0.0229P]$   
 where  $P = (F_o^2 + 2F_c^2)/3$   
 $(\Delta/\sigma)_{\max} = 0.010$   
 $\Delta\rho_{\max} = 0.15 \text{ e \AA}^{-3}$   
 $\Delta\rho_{\min} = -0.15 \text{ e \AA}^{-3}$

### Special details

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.

### Fractional atomic coordinates and isotropic or equivalent isotropic displacement parameters ( $\text{\AA}^2$ )
