Received 6 January 2010; accepted 18 January 2010

Key indicators: single-crystal X-ray study;  $T = 298$  K; mean  $\sigma(\text{Mo}=\text{O}) = 0.005$  Å; disorder in solvent or counterion;  $R$  factor = 0.035;  $wR$  factor = 0.082; data-to-parameter ratio = 14.8.

The title compound,  $\text{KNa}[\text{H}_6\text{PtMo}_6\text{O}_{24}] \cdot 11\text{H}_2\text{O}$ , contains a discrete hexamolybdoplatinate(IV)  $[\text{H}_6\text{PtMo}_6\text{O}_{24}]^{2-}$  polyanion (1 symmetry), which has the highest level of protonation. Five O atoms of the central  $\text{PtO}_6$  octahedron ( $\mu_3$ -atoms, Oc) and one O atom of an outer edge-sharing  $\text{MoO}_6$  octahedron (O bridging  $\mu_2$ -atom, Ob) are protonated. The polyanions are connected by almost linear  $\text{O}-\text{H}\cdots\text{O}$  hydrogen bonds between protonated and unprotonated Ob atoms. Further consolidation of the crystal structure is accomplished by extensive  $\text{O}-\text{H}\cdots\text{O}$  hydrogen bonding involving the uncoordinated water molecules. The two independent  $\text{K}^+$  cations are equally disordered about a twofold rotation axis.

### Related literature

For other crystal structures containing the  $[\text{H}_6\text{PtMo}_6\text{O}_{24}]^{2-}$  anion, see: Lee & Sasaki (1994); Lee & Joo (2006a,b). For background to the bond-valence method, see: Brown & Altermatt (1985); Brese & O'Keeffe (1991).

## Monopotassium monosodium hexahydrogen $\alpha$ -hexamolybdoplatinate(IV) undecahydrate

U. Lee and H.-C. Joo

### Comment

In our previous studies we isolated the same polyanion,  $[H_6PtMo_6O_{24}]^{2-}$ , that is present in the title compound, (I), at various pH conditions; 1.60 (II; Lee & Joo, 2006b), 0.70 (III; Lee & Sasaki, 1994) and 0.48 (IV; Lee & Joo, 2006a). Structures (II, III) have the same space group, *viz.*  $C2/c$ , whereas the space group of (IV) is  $P\bar{1}$ . The polyanions bear an inversion center in these three structures. The current study was carried out to confirm the presence of a highly protonated species that exists at very low pH.

The structure of the present crystals contains a crystallographically discrete  $[H_6PMo_6O_{24}]^{2-}$  polyanion (Fig. 1). All atoms in the polyanion are located in general positions and consequently the symmetry of the polyanion is  $C1$ . The O atoms of the polyoxometalate were designated as  $O_t$  (terminal Mo=O atom),  $O_b$  (O bridging  $\mu_2$ -O atom), and  $O_c$  ( $\mu_3$ -O atom). The protonated O atoms in the polyanion were identified in difference Fourier maps and by using structural features as observed in the previously determined structures II & IV, *viz.* bond lengths of Mo– $O_c(H)$  & Mo– $O_b(H)$  units, bond angles of Mo– $O_c(H)$ –Mo & Mo– $O_b(H)$ –Mo units, and distances between Mo–Mo. As a result, the structure of (I) confirms the protonation of atoms  $O_{1c}(H)$ ,  $O_{3c}(H)$ ,  $O_{4c}(H)$ ,  $O_{5c}(H)$ ,  $O_{6c}(H)$  and  $O_{8b}(H)$ .

The different bond-lengths and bond-angles in the  $[H_6PtMo_6O_{24}]^{2-}$  polyanion of protonated and unprotonated O atoms are compared in Table 1. The protonated O atoms of  $[H_6PtMo_6O_{24}]^{2-}$  in the structures (II), (III) and (IV) show the same protonation scheme, *viz.* four  $O_c(H)$  and two  $O_b(H)$  atoms are protonated. Therefore, the feature of the three-dimensional hydrogen bonding formation is very similar in the these polyanions, *viz.* the central  $PtO_2(OH)_4$  polyhedron forms hydrogen bonds with neighbouring polyanions by four sets of  $O_c(H)\cdots O_t$  and  $O_b(H)\cdots O_t$  hydrogen bonds.

However, the protonation scheme of the polyanion in (I) is different, consisting of five  $O_c(H)$  and one  $O_b(H)$  protonated O atoms (Fig. 1). In contrast to the hydrogen bonding scheme in (II-IV), the protonated  $O_c$  atoms form various O–H $\cdots$ O hydrogen bonds with water molecules ( $O_w$ ). Nevertheless, the polyanion is linearly connected by an  $O_{8b}\cdots H_8\cdots O_{11b^i}$  hydrogen bond (Fig.2 and Table 2).

The Na and K ions are coordinated by O atoms as  $[Na(Ow)_5(O_t)]^+$  in the range 2.371 (7)-2.510 (9) Å, and  $[K_1(O_t)_4(Ow)_2]^+$  and  $[K_2(O_t)_3(Ow)_4]^+$  in the range 2.59 (1)-3.41 (1) Å. Bond valence sum calculations (BVS; Brown & Altermatt, 1985; Brese & O'Keeffe, 1991) for the K1 and K2 ions reveal a considerable undersaturation in terms of valence units which we ascribe to the disordered character of the metal positions.

### Experimental

Crystals of the title compound were prepared by the reaction of  $Na_2MoO_4 \cdot 2H_2O$  and  $K_2Pt(OH)_6$  at pH 0.20 as described in a previous report (Lee & Sasaki, 1994).

## Refinement

The Oc and Ob bound H atoms in the polyanion were located in difference Fourier maps and were freely refined except H5. H5 was refined with a distance restraint [ $O5c-H5 = 0.85 (10)$  Å]. All water molecules bound H atoms were located in difference Fourier maps and their positional parameters were refined with a distance restraint [ $O-H = 0.85 (10)$  Å, but  $O6w-6HA = 0.75 (10)$  Å] and an additional angle restraint; these H atoms were refined with an isotropic displacement parameter  $U_{iso} = 1.5U_{eq}(O)$ . O5w bound H atoms were placed in calculated positions. They were included in the refinement using the riding-motion approximation, with  $U_{iso}(H) = 1.5 U_{eq}(O)$ . K1 and K2 showed very large displacement parameters under consideration of full occupation. Refinement of the site occupation factors (s.o.f.) converged at values close to half-occupation. In the final refinement the s.o.f.'s were constrained to 0.5 and reasonable displacement parameters were eventually obtained.

## Figures

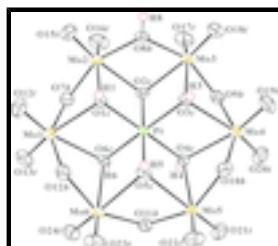

Fig. 1. The structure of the polyanion in compound (I). Displacement ellipsoids are drawn at the 50% probability level for all non-H atoms. The latter are displayed as spheres of arbitrary radius.

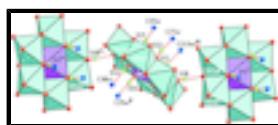

Fig. 2. Polyhedral view of the  $Ob-H\cdots Ob$  contact of the inter-anion hydrogen bond and  $Oc-H\cdots Owh$ hydrogen bonds shown as dashed lines. [Symmetry codes: (i)  $x, -y + 1, z - 1/2$ ; (ii)  $-x + 1, -y + 1, -z + 1$ ; (iii)  $-x + 3/2, -y + 3/2, -z + 1$ ; (vi)  $x, -y + 1, z + 1/2$ .]

33 restraints	$\Delta\rho_{\text{min}} = -1.26 \text{ e \AA}^{-3}$

### Special details

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
