Received 5 January 2010; accepted 8 January 2010

Key indicators: single-crystal X-ray study; $T = 293\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.023\text{ \AA}$; H-atom completeness 85%; disorder in main residue; R factor = 0.056; wR factor = 0.121; data-to-parameter ratio = 12.2.

The asymmetric unit of the title compound, $[\text{Ni}(\text{C}_8\text{H}_7\text{N}_3)_3]_2[\text{SiMo}_{12}\text{O}_{40}] \cdot 4\text{H}_2\text{O}$, consists of a complex $[\text{Ni}(\text{C}_8\text{H}_7\text{N}_3)_3]^{2+}$ cation, half of a Keggin-type heteropolyanion $[\text{SiMo}_{12}\text{O}_{40}]^{4-}$ and two uncoordinated water molecules. The Ni^{2+} cation is surrounded in a slightly distorted octahedral coordination by six N atoms from three chelating 3-(2-pyridyl)-1*H*-pyrazole ligands. In the heteropolyanion, two O atoms of the central SiO_4 group ($\bar{1}$ symmetry) are equally disordered about an inversion centre. $\text{N}-\text{H}\cdots\text{O}$ and $\text{O}-\text{H}\cdots\text{O}$ hydrogen bonding between the cations, anions and the uncoordinated water molecules leads to a consolidation of the structure.

Bis{tris[3-(2-pyridyl)-1H-pyrazole]nickel(II)} dodecamolybdosilicate tetrahydrate

X. Zhang, D. Yuan, P. Wei, B. Li and B. Hu

Comment

The design and synthesis of polyoxometalates has attracted continuous research interest not only because of their appealing structural and topological novelties, but also due to their interesting optical, electronic, magnetic, and catalytic properties, as well as their potential medical applications (Pope & Müller, 1991). In our research group, organic amines, such as 3-(2-pyridyl)pyrazole and pyrazine, are used to effectively modify polyoxomolybdates under hydrothermal condicions (Zhang, Dou *et al.*, 2009; Zhang, Wei, Sun *et al.*, 2009; Zhang, Wei, Shi *et al.*, 2010). Here, we describe the synthesis and structural characterization of the title compound.

As shown in Figure 1, the title compound consists of three subunits, *viz.* of a complex $[\text{Ni}(\text{C}_8\text{H}_7\text{N}_3)_3]^{2+}$ cation, a $[\text{SiMo}_{12}\text{O}_{40}]^{4-}$ heteropolyanion and of two uncoordinated water molecules. The nickel(II) ion is in a distorted octahedral coordination by six N atoms from three chelating 3-(2-pyridyl)pyrazole ligands. The Ni—N bond lengths are in the range of 2.063 (10)—2.131 (9) Å. In the Keggin-type heteropolyanion, each Mo atom is surrounded by six O atoms and the Si atom is located at the center of the anion. There are four kinds of O atoms present in the anion according to their coordination environments: O_a (O atoms in the disordered SiO_4 tetrahedron), O_b (bridging O atoms between two triplet groups of MoO_6 octahedra), O_c (bridging O atoms within one triplet group of MoO_6 octahedra) and O_d (terminal O atoms). The Si—O bond distances are in the normal range of 1.571 (15)—1.635 (12) compared to reported distances in other dodecamolybdsilicates (Wu *et al.*, 2003; Zhang, Wei, Zhu *et al.*, 2010). The Mo—O bond distances vary widely from 1.627 (7) to 2.510 (15) Å. The shortest Mo—O bonds are in the range of 1.627 (7)—1.694 (7) Å for the terminal oxygen atoms. The longest Mo—O lengths are in the range of 2.2279 (14)—2.510 (15) Å for those oxygen atoms connected with both Mo and Si atoms.

N—H···O and O—H···O hydrogen bonding between the cationic and anionic moieties and the uncoordinated water molecules leads to a consolidation of the structure (Fig. 2; Table 2).

The TGA curve shows that the lattice water molecules and the organic ligands separate above *ca* 326 and 657 K, respectively. The overall thermal decomposition process can be described by the followed equation: $\text{C}_{48}\text{H}_{50}\text{Mo}_{12}\text{N}_{18}\text{Ni}_2\text{O}_{44}\text{Si} + 81\text{O}_2 \rightarrow 25\text{H}_2\text{O} + 48\text{CO}_2 + 9\text{N}_2\text{O}_5 + 2\text{NiO} + \text{SiO}_2 + 12\text{MoO}_3$.

Experimental

A mixture of 3-(2-pyridyl)pyrazole (1 mmol 0.14 g), sodium molybdate (2 mmol, 0.48 g), sodium silicate nonahydrate (0.2 mmol, 0.05 g) and nickel(II) chloride hexahydrate (0.25 mmol, 0.05 g) in 10 ml distilled water was sealed in a 25 ml Teflon-lined stainless steel autoclave and was kept at 433 K for three days. Green crystals suitable for the X-ray experiment were obtained. Anal. $\text{C}_{48}\text{H}_{50}\text{Mo}_{12}\text{N}_{18}\text{Ni}_2\text{O}_{44}\text{Si}$: C, 20.02; H, 1.75; N, 8.75%. Found: C, 19.28; H, 2.07; N, 8.43%. IR(cm^{-1}): 3376, 3136, 2961, 1614, 1568, 1522, 1457, 1439, 1364, 1300, 1097, 950, 913, 812, 636, 507.

supplementary materials

Refinement

All hydrogen atoms bound to aromatic carbon atoms were refined in calculated positions using a riding model with a C—H distance of 0.93 Å and $U_{\text{iso}} = 1.2U_{\text{eq}}(\text{C})$. Hydrogen atoms attached to aromatic N atoms were refined with a N—H distance of 0.86 Å and $U_{\text{iso}} = 1.2U_{\text{eq}}(\text{N})$. The hydrogen atoms of the two uncoordinated water molecules could not be located unambiguously from difference Fourier maps, probably due to disorder of the water molecules. Thus the structure was refined without the H atoms of the water molecules (which includes the water O atoms O21, O22). In the SiO_4 unit, the two oxygen atoms (O1 and O18) are equally disordered about the inversion centre. One of the bridging O atoms (O12) is also disordered and was refined with split positions and an occupancy ratio of 1:1. In the final difference Fourier map the highest peak is 2.87 Å from atom O22 and the deepest hole is 0.11 Å from atom O8. The highest peak is located in the voids of the crystal structure and may be associated with an additional water molecule. However, refinement of this position did not result in a reasonable model. Hence this position was also excluded from the final refinement.

Figures

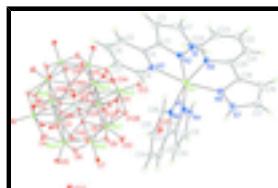

Fig. 1. The building blocks of the title compound with the atom-labelling scheme. Displacement ellipsoids are drawn at the 30% probability level; H atoms are given as spheres of arbitrary radius. [Symmetry code: (A) $-x+1/2, -y+1/2, -z$.]

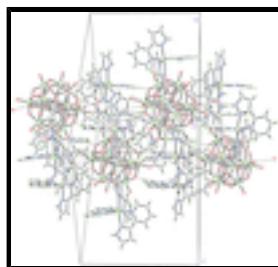

Fig. 2. The crystal packing of the title compound, displayed with N—H···O and O—H···O hydrogen bonds as dashed lines.

Data collection

Bruker APEXII CCD diffractometer	7188 independent reflections
Radiation source: fine-focus sealed tube graphite	3439 reflections with $I > 2\sigma(I)$
phi and ω scans	$R_{\text{int}} = 0.125$
Absorption correction: multi-scan (<i>SADABS</i> ; Bruker, 2001)	$\theta_{\text{max}} = 25.0^\circ, \theta_{\text{min}} = 1.5^\circ$
$T_{\text{min}} = 0.766, T_{\text{max}} = 0.835$	$h = -22 \rightarrow 22$
28737 measured reflections	$k = -19 \rightarrow 19$
	$l = -32 \rightarrow 32$

Refinement

Refinement on F^2	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.056$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.121$	H-atom parameters constrained
$S = 1.00$	$w = 1/[\sigma^2(F_o^2) + (0.020P)^2]$ where $P = (F_o^2 + 2F_c^2)/3$
7188 reflections	$(\Delta/\sigma)_{\text{max}} < 0.001$
587 parameters	$\Delta\rho_{\text{max}} = 1.78 \text{ e \AA}^{-3}$
0 restraints	$\Delta\rho_{\text{min}} = -0.66 \text{ e \AA}^{-3}$

Special details

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
