Received 10 January 2010; accepted 23 January 2010

Key indicators: single-crystal X-ray study; $T = 291\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.005\text{ \AA}$; disorder in solvent or counterion; R factor = 0.050; wR factor = 0.128; data-to-parameter ratio = 14.3.

The title compound, $[\text{Ru}(\text{C}_{14}\text{H}_{12}\text{N}_2)_2(\text{C}_{18}\text{H}_{14}\text{N}_4)](\text{ClO}_4)_2 \cdot 2\text{H}_2\text{O}$, consists of an Ru^{II} complex cation, two perchlorate anions and two uncoordinated water molecules. The Ru^{II} ion is chelated by a 10,11,12,13-tetrahydropyrido[3,2-a:2',3'-c]phenazine ligand and two 2,9-dimethyl-1,10-phenanthroline ligands in a distorted octahedral geometry. The two uncoordinated water molecules are disordered over five positions, with an occupancy factor of about 0.4 for each site. A supramolecular structure is formed by weak $\pi-\pi$ interactions between neighbouring molecules, with centroid–centroid distances of 3.618 (2) and 3.749 (2) \AA .

Comment

Ruthenium(II) complexes have been investigated extensively during the past two decades due to their rich photochemical and photophysical properties (Juris *et al.*, 1988). Ruthenium complexes have been applied in many important fields, such as catalysis, antitumor drugs and DNA structural probe. $[\text{Ru}(R\text{-binap})(\text{H})_2(\text{tmen})]$ (binap = bidentate phosphine; tmen = $\text{H}_2\text{NCMe}_2\text{CMe}_2\text{NH}_2$) can catalyze the hydrogenation of ketone (Abdur-Rashid *et al.*, 2002). Complex $\text{ImH}[\text{trans-Ru(III)}\text{Cl}_4(\text{DMSO})\text{Im}]$ (Im = imidazole; DMSO = dimethyl sulfoxide) was the first ruthenium complex to enter clinical trials against metastases (Cocchietto & Sava, 2000; Zorzet *et al.*, 2001). In an attempt to obtain more insight into the structural properties of such ruthenium(II) complexes, we present here the crystal structure of the title complex.

The crystal structure of the title compound reveals that all the bond lengths and angles have normal values (Table 1). There are one Ru^{II} complex cation, two perchlorate anions and two uncoordinated water molecules per asymmetric unit (Fig. 1). The two uncoordinated water molecules are disordered over five different positions and theirs site occupancy factors are 0.392 (8), 0.410 (9), 0.388 (9), 0.402 (9), and 0.408 (9) for O1W, O2W, O3W, O4W, and O5W, respectively. The Ru^{II} ion is in a distorted octahedral environment, coordinated by N5, N6, N7, N8 from two 2,9-dimethyl-1,10-phenanthroline (dmp) ligands, and N1, N2 from one 10,11,12,13-tetrahydropyrido[3,2-a:2',3'-c]phenazine (dpqc) ligand (Fig. 1). The weak π - π interactions between the neighbouring molecules are occurred (Fig. 2). The perpendicular distance of $Cg1 \cdots Cg1^i$ from face to face is 3.50 (2) Å and the centroid–centroid distance of $Cg1 \cdots Cg1^i$ is 3.749 (2) Å [$Cg1$ is the centroid of C23, C24, C25, C26, C31 and C32 ring; symmetry code: (i) 1/2-x, 3/2-y, z]. The other perpendicular distance of $Cg2 \cdots Cg2^{ii}$ from face to face is 3.48 (2) Å and the centroid–centroid distance of $Cg2 \cdots Cg2^{ii}$ is 3.618 (2) Å [$Cg2$ is the centroid of C37, C38, C39, C40, C45 and C46 ring; symmetry code: (ii) -x, 2-y, -z]. Through π - π interactions, a supramolecular structure is formed. There are channels along the [1 0 1] direction filled with the uncoordinated water molecules and perchlorate anions (Fig. 3).

Experimental

Ligand dpqc was prepared by a modified method reported in the literature (Dickeson & Summers, 1970). A mixture of phenanthroline-5,6-diamine (0.210 g, 1 mmol), 1,2-cyclohexanedione (0.112 g, 1 mmol) and glacial acetic acid (30 cm³) was refluxed with stirring for 6 h. The cooled solution was diluted with water and neutralized with concentrated aqueous ammonia. A pale yellow-green precipitate was obtained. The product was recrystallized from methanol to give pale yellow-green powders.

The title complex was synthesized by the modified method (Pellegrini & Aldrich-Wright, 2003). A mixture of *cis*- $[\text{Ru}(\text{dmp})_2\text{Cl}_2]\text{.2H}_2\text{O}$ (0.288 g, 0.5 mmol) and dpqc (0.161 g, 0.5 mmol) in EtOH (40 cm³) was refluxed under argon for 8 h to give a clear red solution. Upon cooling, a red precipitate was obtained by dropwise addition of saturated aqueous

supplementary materials

NaClO₄ solution. The crude product was purified by column chromatography on a neutral alumina with CH₃CN-toluene (v/v 3:1) as eluent. The mainly brown red band was collected. The solvent was removed under reduced pressure and a red powder was obtained. Red single crystals of the title complex suitable for X-ray crystallographic study were obtained from acetonitrile and ethanol (v/v 1:3) at room temperature.

Refinement

In the asymmetric unit there are two disordered water molecules. They occupy five different positions and theirs site occupancy factors were refined with free variable and validated as 0.392 (8), 0.410 (9), 0.388 (9), 0.402 (9) and 0.408 (9) for O1W, O2W, O3W, O4W, and O5W, respectively.

H atoms on C atoms were positioned geometrically and refined as riding atoms, with C—H = 0.93 (CH), 0.97 (CH₂) and 0.96 (CH₃) Å and with $U_{\text{iso}}(\text{H}) = 1.2(1.5 \text{ for methyl})U_{\text{eq}}(\text{C})$. H atoms of water molecules were determined based on difference Fourier maps and possible hydrogen bonding scheme and refined as riding, with $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{O})$. The highest residual electron density was found 1.14 Å from O3W and the deepest hole 0.56 Å from Ru1.

Figures

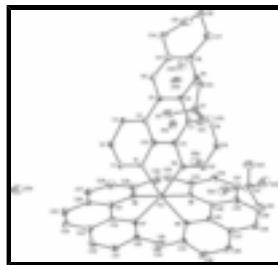

Fig. 1. Molecular structure of the title compound. Displacement ellipsoids are drawn at the 30% probability level. H atoms have been omitted for clarity. The two disordered water molecules occupy five different positions, O1W, O2W, O3W, O4W and O5W.

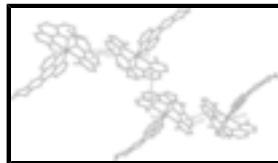

Fig. 2. A view of π – π interactions between the neighbouring molecules. H atoms have been omitted for clarity. [Symmetry codes: (i) 1/2-x, 3/2-y, z; (ii) -x, 2-y, -z; (iii) -1/2+x, 1/2+y, z.]
