Received 26 January 2010; accepted 26 January 2010

Key indicators: single-crystal X-ray study;  $T = 200$  K; mean  $\sigma(\text{C}-\text{C}) = 0.006$  Å;  
 $R$  factor = 0.045;  $wR$  factor = 0.111; data-to-parameter ratio = 19.2.

The asymmetric unit of the title compound,  $[\text{Mn}_2(\text{C}_{20}\text{H}_{12}\text{Br}_2\text{N}_2\text{O}_2)_2\text{Cl}_2] \cdot 2\text{C}_3\text{H}_7\text{NO}$ , contains one half of a centrosymmetric dinuclear Mn<sup>III</sup> complex and an *N,N*-dimethylformamide solvent molecule. In the complex, the two Mn<sup>III</sup> ions are bridged by two O atoms from two symmetry-related *N,N'*-bis(5-bromosalicylidene)-1,2-diimino-benzene dianionic ligands with the longer Mn—O distance of 2.703 (3) Å, thus each Mn ion is six-coordinated by two N and three O atoms from the two dianionic ligands and one capping Cl atom in a distorted octahedral environment. The crystal structure displays intermolecular  $\pi$ – $\pi$  interactions between adjacent benzene rings, with a shortest centroid–centroid distance of 3.673 (2) Å, and intermolecular C—H···O, C—H···Cl and C—H···Br hydrogen bonds.

## Related literature

**Comment**

The title compound,  $[\text{Mn}(\text{C}_{20}\text{H}_{12}\text{Br}_2\text{N}_2\text{O}_2)\text{Cl}]_2 \cdot 2(\text{C}_3\text{H}_7\text{NO})$ , consists of a structurally centrosymmetric dinuclear  $\text{Mn}^{\text{III}}$  complex and two *N,N*-dimethylformamide solvent molecules, and the asymmetric unit contains one half of the formula unit (Fig. 1). In the complex, two  $\text{Mn}^{\text{III}}$  ions are bridged by two phenolic O atoms from two symmetry-related *N,N*-bis(5-bromosalicylidene)-1,2-diiminobenzene dianionic ligands, and the distance between the Mn atoms is 3.5277 (10) Å. Each Mn ion is six-coordinated by two N and three O atoms from the two dianionic ligands and one capping Cl atom in a distorted octahedral environment (Table 1). While the two Mn—N bond distances are nearly equal [1.991 (3) Å and 1.994 (3) Å], the three Mn—O bond lengths are somewhat different. The equatorial Mn1—O1/O2 bonds [1.869 (3) Å and 1.884 (3) Å] are considerably shorter than the axial Mn1—O2<sup>a</sup> bond [Symmetry code: (a) 1 - x, -y, 1 - z; 2.703 (3) Å]. Within the equatorial plane, the chelating angles lie in the range of 82.42 (14)°–92.38 (14)° and the <O1—Mn1—O2 bond angle is 90.84 (12)°. The apical <Cl1—Mn1—O2<sup>a</sup> bond angle is 173.85 (7)°. The crystal structure displays intermolecular  $\pi$ – $\pi$  interactions between adjacent benzene rings, with a shortest centroid-centroid distance of 3.673 (2) Å, and intermolecular C—H···O/Cl/Br hydrogen bonds (Fig. 2 and Table 2).

**Experimental**

$\text{Mn}(\text{CH}_3\text{CO}_2)_3 \cdot 2\text{H}_2\text{O}$  (0.50 g, 1.86 mmol), NaCl (0.11 g, 1.88 mmol) and *N,N*-bis(5-bromosalicylidene)-1,2-diiminobenzene (0.89 g, 1.88 mmol) in EtOH (50 ml) and acetone (20 ml) were stirred for 2 h at room temperature. The formed precipitate was separated by filtration and washed with acetone and ether and dried under vacuum, to give a dark brown powder (1.02 g). Crystals suitable for X-ray analysis were obtained by slow evaporation under vacuum from an *N,N*-dimethylformamide solution.

**Refinement**

H atoms were positioned geometrically and allowed to ride on their respective parent atoms [C—H = 0.95 Å (CH) or 0.98 Å (CH<sub>3</sub>) and  $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{CH})$  or  $1.5U_{\text{eq}}(\text{CH}_3)$ ].

### Refinement

Refinement on  $F^2$

Primary atom site location: structure-invariant direct methods

Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.045$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.111$	H-atom parameters constrained
$S = 1.01$	$w = 1/[\sigma^2(F_o^2) + (0.0372P)^2]$ where $P = (F_o^2 + 2F_c^2)/3$
5763 reflections	$(\Delta/\sigma)_{\max} < 0.001$
300 parameters	$\Delta\rho_{\max} = 0.73 \text{ e \AA}^{-3}$
0 restraints	$\Delta\rho_{\min} = -0.87 \text{ e \AA}^{-3}$

### Special details

**Geometry.** All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
