Key indicators: single-crystal X-ray study; $T = 292\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.007\text{ \AA}$; disorder in main residue; R factor = 0.062; wR factor = 0.195; data-to-parameter ratio = 10.7.

In the title molecule, $C_{24}H_{31}N_5O_6$, the two ethyl fragments are each disordered over two conformations [occupancy ratios 0.58 (13)/0.42 (13) and 0.56 (12)/0.44 (12)]. The crystal packing exhibits intermolecular non-classical C–H···O hydrogen bonds and π – π interactions between benzene rings [centroid–centroid distances = 3.836 (5) \AA].

Comment

As a continuation of our structural studies of glucouril derivatives (Wang *et al.*, 2006; Chen *et al.*, 2007), herein we report the crystal structure of the title compound, (I) (Fig. 1). In the title compound, a benzene ring is fused to one seven-membered ring, which binds two of the N atoms from separate rings of the glycoluril system, and the other two N atoms are linked to *tert*-butylamine by two methylene group.

Experimental

The title compound was synthesized according to the reported literature (Wu *et al.*, 2002). Crystals of (I) suitable for X-ray diffraction were grown by slow evaporation of a dichloromethane-methanol (1:2) solution of the title compound under 293 K.

Refinement

All H-atoms were positioned geometrically in idealized positions and constrained to ride on their parent atoms, with $d(C-H) = 0.97 \text{ \AA}$, $U_{\text{iso}} = 1.2U_{\text{eq}}$ (C) for CH_2 and $d(C-H) = 0.96 \text{ \AA}$, $U_{\text{iso}} = 1.5U_{\text{eq}}$ (C) for CH_3 atoms. The two ethyl group were treated as disordered over two positions. The occupancies of the disordered positions refined to 0.58 (13)/0.42 (13) and 0.56 (12)/0.44 (12), respectively.

Figures

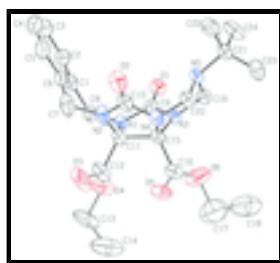

Fig. 1. A view of (I), showing the atom-labelling scheme, with displacement ellipsoids drawn at the 30% probability level. Only major parts of disordered atoms are shown. H atoms omitted for clarity.

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
