

N-Benzoyl-N'-phenylurea

Andrzej Okuniewski, Jarosław Chojnicki and Barbara Becker*

Department of Inorganic Chemistry, Gdańsk University of Technology, Narutowicza 11/12, 80-233 Gdańsk, Poland

Correspondence e-mail: barbara.becker@pg.gda.pl

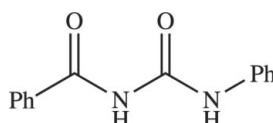

Received 8 January 2010; accepted 14 January 2010

Key indicators: single-crystal X-ray study; $T = 150\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.003\text{ \AA}$; R factor = 0.039; wR factor = 0.098; data-to-parameter ratio = 10.5.

In the title compound, $\text{C}_{14}\text{H}_{12}\text{N}_2\text{O}_2$, the molecular conformation is determined by a strong intramolecular $\text{N}-\text{H}\cdots\text{O}=\text{C}$ hydrogen bond. In the crystal, pairs of molecules are connected by intermolecular $\text{N}-\text{H}\cdots\text{O}=\text{C}$ hydrogen bonds, forming centrosymmetric dimers. No specific interactions between dimers could be found.

Related literature

For related structures, see: Bart *et al.* (1989); Zhong *et al.* (1998); Moon *et al.* (2002), Yamin & Mardi (2003); Chen *et al.* (2004); Su (2005); Yan *et al.* (2007, 2008); Liu *et al.* (2008, 2008a,b). For graph-set notation, see: Etter (1990). The title compound was obtained as a byproduct during the synthesis of a copper(I) complex with *N*-benzoyl-*N'*-phenylthiourea prepared according to Frank & Smith (1948).

N-Benzoyl-N'-phenylurea

A. Okuniewski, J. Chojnacki and B. Becker

Comment

N-Benzoyl-*N'*-phenylurea halogeno derivatives are used as pesticides. For instance 1-(3,5-dichloro-2,4-difluorophenyl)-3-(2,6-difluorobenzoyl)urea was found to act as chitin synthesis inhibitor (Zhong *et al.*, 1998).

N-benzoyl-*N'*-phenylurea molecules adopt a conformation that allows formation of N—H···O=C intramolecular hydrogen bonds, denoted as **R**(6) in graph set notation (Etter, 1990). This conformation is commonly noted among all *N'*-mono-substituted or *N'*-unsubstituted *N*-benzoylureas and *N*-benzoylthioureas (see: related structures). Additional N—H···O=C intermolecular **R**²(8) hydrogen bonds bind two urea derivative molecules to form a centrosymmetric dimer (Fig. 1), which is also common. Only one known structure does not exhibit such a motif (Moon *et al.*, 2002).

No π – π stacking interactions can be found in this structure (closest ring centroids distance is about 5.60 Å with the dihedral angle between the rings α about 80°).

The dihedral angle N1—C1—N2—C2 describing the twist of two amide subunits of urea derivatives is equal to 3.0 (2)°. This value is in the range known from other studies: from 0.07° (Yan *et al.*, 2007) to 7.45° (Su, 2005).

Experimental

N-benzoyl-*N'*-phenylurea was obtained as a byproduct during the synthesis of a copper(I) complex with *N*-Benzoyl-*N'*-phenylthiourea prepared according to Frank & Smith (1948). Obviously the ligand underwent basic hydrolysis with CH₃ONa in acetone. Colourless single crystals suitable for X-ray diffraction analysis were isolated from the reaction mixture after it was kept at room temperature for a few days. From 5.12 g (0.02 mol) of thiourea derivative 0.87 g of *N*-benzoyl-*N'*-phenylurea was obtained. Yield: 18%.

Refinement

All hydrogen atoms were found from difference Fourier map and refined without constraints.

Figures

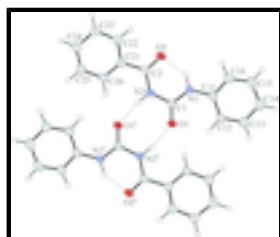

Fig. 1. Structure of centrosymmetric *N*-benzoyl-*N'*-phenylurea dimer. Ellipsoids are drawn at 50% probability level. Symmetry code: (i) $-x+1, -y+1, -z$.

Refinement

Refinement on F^2	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)]$ = 0.039	Hydrogen site location: difference Fourier map
$wR(F^2)$ = 0.098	Only H-atom coordinates refined
S = 0.94	$w = 1/[\sigma^2(F_o^2) + (0.0656P)^2]$ where $P = (F_o^2 + 2F_c^2)/3$
2221 reflections	$(\Delta/\sigma)_{\text{max}} < 0.001$
211 parameters	$\Delta\rho_{\text{max}} = 0.22 \text{ e \AA}^{-3}$
0 restraints	$\Delta\rho_{\text{min}} = -0.14 \text{ e \AA}^{-3}$

Special details

Geometry. All s.u.'s (except the s.u. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell s.u.'s are taken into account individually in the estimation of s.u.'s in distances, angles and torsion angles; correlations between s.u.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell s.u.'s is used for estimating s.u.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > 2\sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
