Received 22 January 2010; accepted 29 January 2010

Key indicators: single-crystal X-ray study;  $T = 100$  K; mean  $\sigma(C-C) = 0.005$  Å; H-atom completeness 98%;  $R$  factor = 0.046;  $wR$  factor = 0.162; data-to-parameter ratio = 15.0.

The title complex,  $[Ni_4(C_{36}H_{40}N_2O_2)_2(OH)_4(C_3H_9OP)_2(H_2O)_4] \cdot 2C_4H_{10}O \cdot 2C_3H_9OP \cdot 2H_2O$ , is centrosymmetric with a central core that can be described as a defect double cubane. The four metal ions in the cluster are held together by four bridging hydroxide groups. Each  $Ni^{II}$  atom adopts a distorted octahedral geometry.

**Comment**

The X-ray structural determination of the title compound [ $\text{FI}^2\text{---Ni}_2(\text{O=PMe}_3)(\text{H}_2\text{O})_2(\mu_2\text{-OH})(\mu_3\text{-OH})_2\text{.2(O=PMe}_3)\text{.2(Et}_2\text{O)}\text{.2(H}_2\text{O)}$ , (*I*),  $\text{FI}^2 = 2,7\text{-di}(2,6\text{-diisopropylphenyl)imino-1,8-naphthalenediolato}$ ] reveals a tetra-nuclear nickel complex (Figure 1). This hydrated complex is centrosymmetric with a central core that can be described as a defect double cubane with two missing vertices. The four nickel(II) ions in the cluster are held together by four bridging hydroxide groups. In the defect dicubane core, two types of distorted octahedrally coordinated nickel(II) ions can be observed. Atom Ni1 is coordinated by two  $\mu_3\text{-OH}$  (O4 and O4'), one  $\mu_2\text{-OH}$  (O5'), and the  $\text{FI}^2$  ligand in a bidentate chelating mode through the two phenolate oxygen atoms (O1, O2). The nickel coordination is completed by one trimethylphosphine oxide ligand (O8). Atom Ni2 is coordinated by one  $\mu_3\text{-OH}$  (O4'), one  $\mu_2\text{-OH}$  (O5), and the  $\text{FI}^2$  ligand in a bidentate chelating mode through the imine nitrogen atom and a phenolate oxygen atom (N2 and O2, respectively). Two water molecules complete the coordination geometry (O6 and O7). The presence of hydroxyl groups and water molecules are confirmed by Bond Valence Sum calculations (0.28 v.u. for  $\text{H}_2\text{O}$ , 0.68 v.u. for  $\mu_2\text{-OH}$  and 1.02 v.u. for  $\mu_3\text{-OH}$ ; Brese & O'Keeffe, 1991). Defect dicubane-like structures are common in literature [nickel(II), copper(II), cobalt(II), iron(II) and manganese(II); King *et al.*, 2004 and references herein] and exhibit similar bond distances and angles with respect to the present product. In **I** the intramolecular Ni..Ni distances range from 3.052 (1) to 3.073 (4) Å. These values are shorter than the sum of Ni atomic van der Waals radii (3.3 Å) and may indicate chemically significant interactions (Soldatov *et al.*, 2001 and references herein).

**Experimental**

In attempts to grow crystals of {2,7-di-[(2,6-diisopropylphenyl)imino]-1,8-naphthalenediolato}(methyl) (trimethylphosphine)nickel(II) (Rodriguez *et al.*, 2008, 2009) by slow diffusion of hexane into ethyl ether solutions under inert atmosphere, small quantities of yellow block-like crystals of the hydrated dimeric decomposition title product were isolated.

**Refinement**

The hydrogen atoms were introduced into the geometrically calculated positions and refined using a riding model with distance C—H = 0.95 Å,  $U_{\text{iso}} = 1.2 U_{\text{eq}}(\text{C})$  for aromatic atoms and imine groups, C—H = 0.98 Å,  $U_{\text{iso}} = 1.5 U_{\text{eq}}(\text{C})$  for methyl groups, C—H = 0.99 Å,  $U_{\text{iso}} = 1.2 U_{\text{eq}}(\text{C})$  for methylene groups and C—H = 1.00 Å,  $U_{\text{iso}} = 1.2 U_{\text{eq}}(\text{C})$  for methine groups. The hydrogen atoms on the hydroxyl groups (O4 and O5) and water molecules (O6, O7 and O11) could not be located in the difference Fourier map or placed geometrically, and therefore were omitted from the refinement. A bond valence sum (BVS; Brese & O'Keeffe, 1991) calculation was applied to determine the valences of these oxygen atoms. The

## *Refinement*

Refinement on $F^2$	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.046$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.162$	H-atom parameters constrained
$S = 1.00$	$w = 1/[\sigma^2(F_o^2) + (0.1064P)^2]$ where $P = (F_o^2 + 2F_c^2)/3$
8609 reflections	$(\Delta/\sigma)_{\max} = 0.001$
575 parameters	$\Delta\rho_{\max} = 0.79 \text{ e \AA}^{-3}$
0 restraints	$\Delta\rho_{\min} = -0.89 \text{ e \AA}^{-3}$

## *Special details*

**Geometry.** All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
