Received 2 February 2010; accepted 9 February 2010

Key indicators: single-crystal X-ray study; $T = 296$ K; mean $\sigma(C-C) = 0.002$ Å;
 R factor = 0.016; wR factor = 0.042; data-to-parameter ratio = 13.6.

The title compound $[Cd(L)_2(H_2O)_2]_n$ ($L = 3$ -pyridine-propionic acid, $C_8H_8NO_2$), is a two-dimensional coordination polymer in which the Cd^{II} ion lies on an inversion center and is coordinated in a slightly distorted octahedral environment. The aqua H atoms are involved in intermolecular O–H···O hydrogen bonds, which extend the two-dimensional structure to a three-dimensional architecture. The Cd···Cd separation within a layer is 9.0031 (1) Å.

Comment

Coordination polymers have gained attention due to their desirable properties applicable to size-selective adsorption, gas storage, host–guest recognition, catalysis, and photoluminescence (Batten *et al.*, 2009; Perry IV *et al.*, 2009; Robin & Fromm, 2006). We have been continually interested in the preparation, structures, and properties of coordination polymers based on the linking ligands of pyridine carboxylate derivatives, in which the carboxylate groups are directly attached to the pyridine ring (Huh & Lee, 2006; Huh & Lee, 2007; Huh & Lee, 2008; Kim *et al.*, 2007; Min *et al.*, 2001; Min *et al.*, 2002; Min & Lee, 2002).

Linking ligands containing both N-donors and O-donors are frequently used for the construction of coordination polymers (Lu, 2003). In particular, silver, copper, zinc, cobalt, and nickel coordination polymers containing 3-pyridinepropionic acid as a linking ligand have been reported (Wang *et al.*, 2006; Martin *et al.*, 2007). This ligand has an ethylene ($-\text{CH}_2\text{--CH}_2-$) spacer between the pyridyl and carboxylate groups and therefore is flexible. As an extension of our study, we investigated the preparation of cadmium coordination polymers by employing this ligand.

The title compound is isostructural with the zinc (Wang *et al.*, 2006), cobalt, and nickel (Martin *et al.*, 2007) analogs with the empirical formula $[\text{Cd}(\text{L})_2(\text{H}_2\text{O})_2]$ (L = 3-pyridinepropionic acid). The local coordination environment around the Cd atom and the atom-numbering scheme is shown in Fig. 1. The asymmetric unit consists of one half Cd^{II} ion, one L ligand, and one aqua ligand. The Cd^{II} ion lies on a crystallographic inversion center, and the remaining atoms occupy general positions. The coordination environment of the Cd^{II} ion is slightly-distorted octahedral. The monomer units $[\text{Cd}(\text{L})_2(\text{H}_2\text{O})_2]$ are linked by covalent bonds ($\text{Cd}\text{--N}$ and $\text{Cd}\text{--O}$) to form a 2-D layer approximately in the (101) plane (Fig. 2) and then extended into a 3-D architecture by hydrogen bonding. Two carboxylate O atoms ($\text{O}2$ and $\text{O}3$) act differently. Whereas $\text{O}2$ acts as a H-bond acceptor to the aqua ligands in the neighboring units, $\text{O}3$ is coordinated to the Cd metal to contribute to the formation of the 2-D layer, in which the $\text{Cd}\cdots\text{Cd}$ separation is 9.0031 (1) Å.

Experimental

A mixture of 3-pyridinepropionic acid (0.98 g, 6.5 mmol), $[\text{Cd}(\text{NO}_3)_2]6(\text{H}_2\text{O})$ (1 g, 3.2 mmol), NaOH (6.5 mmol), and H_2O (6 ml) was heated at 453 K for 2 days in a 23 ml Teflon-lined stainless-steel autoclave and then cooled slowly to room temperature to obtain pale yellow crystals. The product was collected by filtration, washed with H_2O (3×10 ml) and ethanol (5×10 ml), and then air-dried. (1.18 g, 2.6 mmol, 82%). mp: 538–540 K. IR (KBr, cm^{-1}): 3199 (s), 2173 (w), 1606 (s), 1302 (w), 1247 (w), 1201 (w), 1117 (m), 1047 (m), 961 (s), 607 (s)

Refinement

All H atoms were located and refined isotropically.

Refinement

Refinement on F^2	Primary atom site location: structure-invariant direct methods
---------------------	--

Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.016$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.042$	All H-atom parameters refined
$S = 1.05$	$w = 1/[\sigma^2(F_o^2) + (0.0233P)^2 + 0.1949P]$ where $P = (F_o^2 + 2F_c^2)/3$
2113 reflections	$(\Delta/\sigma)_{\max} = 0.001$
155 parameters	$\Delta\rho_{\max} = 0.30 \text{ e \AA}^{-3}$
0 restraints	$\Delta\rho_{\min} = -0.22 \text{ e \AA}^{-3}$

Special details

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
