Received 4 February 2010; accepted 10 February 2010

Key indicators: single-crystal X-ray study; $T = 293\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.015\text{ \AA}$; disorder in main residue; R factor = 0.048; wR factor = 0.142; data-to-parameter ratio = 17.2.

In the title compound, $[\text{UO}_2L_2(\text{NO}_3)_2]$ ($L = N$ -{bis[methyl(phenyl)amino]phosphoryl}-2,2,2-trichloroacetamide, $C_{16}\text{H}_{17}\text{Cl}_3\text{N}_3\text{O}_2\text{P}$ }, the U^{VI} ions are eight-coordinated by axial oxido ligands and six equatorial O atoms from the phosphoryl and nitrate groups in a distorted hexagonal-bipyramidal geometry. There are disordered fragments in the two coordinating L ligands: the trichloromethyl group is rotationally disordered between two orientations [occupancy ratio 0.567 (15): 0.433 (15)] in one ligand, and a methyl(phenyl)amine fragment is disordered over two conformations [occupancy ratio 0.60 (4):0.40 (4)] in the other ligand. In the crystal structure, intramolecular $\text{N}-\text{H}\cdots\text{O}$ hydrogen bonds between the amine and nitrate groups are observed.

Bis(*N*-{bis[methyl(phenyl)amino]phosphoryl}-2,2,2-trichloroacetamide)dinitratodioxidouranium(VI)

K. O. Znovjyak, V. A. Ovchynnikov, T. Y. Sliva, S. V. Shishkina and V. M. Amirkhanov

Comment

Recently, we reported the synthesis and crystal structure of *N*-{bis[methyl(phenyl)amino]phosphoryl}-2,2,2-trichloroacetamide (*L*) (Znovjyak *et al.*, 2009). In our ongoing study of complexation properties of *L* we obtained the title compound, (*I*), and determined its crystal structure.

In (*I*) (Fig. 1), the coordination polyhedra of the uranium ions are slightly distorted hexagonal bipyramids (Keppert, 1982) where oxo ligands fill place of axial positions and two oxygen atoms of the phosphoryl groups from two *L* molecules and four oxygen atoms from two nitrate groups situated in the equatorial positions. The nitrate groups additionally form intramolecular hydrogen bonding with the hydrogen atoms of the N—H groups of the *L* ligands (Table 1). In the crystal structure of the complex, the phosphoryl group is situated in an *anti*-position with respect to the carbonyl group as in the crystal structure of the *L* which was described previously (Znovjyak *et al.*, 2009).

The U—O(oxo ligands) distances are equal to 1.750 (4) Å and 1.756 (4) Å. The U—O(NO₃) and U—O(PO) distances fall in the range 2.515 (4)–2.564 (4) Å and 2.352 (4)–2.372 (4) Å, respectively and close to the corresponding values of the uranium complex with similar ligand previously published (Amirkhanov *et al.*, 1997). The coordinated nitrate groups have almost planar triangular structures. The O—N—O angles of the chelate rings (114.6 (5) and 115.1 (5)°) are shorter as compared to other angles O—N—O (121.9 (5)–123.0 (5)°) and bond lengths are slightly distorted: N—O(non-coordinated) and N—O(coordinated) are in the range of 1.198 (7) Å and 1.255 (7)–1.271 (6) Å, respectively. Bond lengths in the fragment C(O)NHP(O) are slightly changed upon complexation. The P—N bond distances between phosphorus atoms and nitrogen atoms of the amine substituents are shortened with respect to observed values in *L* (1.634 (4)–1.649 (4) Å) and fall in the range 1.621 (5)–1.635 (6) Å, that can be explained by increasing π -donor bonding in the (CH₃N)P(O) fragment due to complexation, but this effect is weaken by π -acceptor influence of the phenyl group. The P—N(NH) and C—N distances do not change upon ligand coordination and are equal to 1.680 (5) Å, 1.683 (5) Å and 1.350 (7) Å, 1.358 (7) Å, respectively. In the non-coordinated molecule (*L*), the P—O bond lengths are 1.483 (3) Å, 1.478 (3) Å, while in (*I*) they are 1.473 (4) Å and 1.492 (4) Å, respectively.

The environment of the phosphorus atoms in the coordinated *L* has a slightly distorted tetrahedral geometry. The environment of the amide nitrogen atoms is practically planar and the sum of the adjacent bond angles is equal to 360° indicating sp²-hybridization.

Experimental

The synthesis of *L* was carried out according to the procedure described previously (Znovjyak *et al.*, 2009).

Hydrated nitrate UO₂(NO₃)₂·2H₂O (1 mmol) was solved upon heating in a methanol (10 ml). The solution was dehydrated by HC(OC₂H₅)₃ (2 mmol), then heated to the boiling point and cooled down. The resulting solution was added to the solution

supplementary materials

of L (2 mmol) in isopropanol (10 ml) and was left in a vacuum desiccator over CaCl_2 at room temperature. After 1 day, the yellow crystals were filtered off and washed with cold isopropanol and dried on the air (yield 85%). IR (KBr, cm^{-1}): 3250 $\nu(\text{NH})$, 1745 $\nu(\text{CO})$, 1595, 1535, 1500, 1450 $\nu(\text{CN})$, 1390, 1280, 1220, 1140 $\nu(\text{PO})$, 1080, 1030, 950, 885, 820, 700.

Refinement

All H atoms were placed at calculated positions and treated as riding on their parent atoms [C—H = 0.93 and 0.96 Å, and $U_{\text{iso}}(\text{H}) = 1.2$ and $1.5U_{\text{eq}}(\text{C})$, N—H = 0.86 Å and $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{N})$]. In one trichloromethyl group, atoms Cl1–Cl3 were treated as disordered between two orientations A and B, respectively, with the occupancies refined to 0.567 (15) and 0.433 (15). The methyl(phenyl)amino fragment (C23, C61–C66) was also treated as disordered over two conformations with the occupancies refined to 0.60 (4) and 0.40 (4), respectively.

Figures

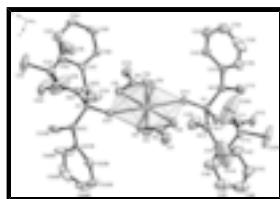

Fig. 1. View of (I) with atomic numbering. Displacement ellipsoids are drawn at the 25% probability level. Only major parts of disordered atoms are shown. Hydrogen atoms omitted for clarity.

Refinement

Refinement on F^2	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.048$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.142$	H-atom parameters constrained
$S = 0.97$	$w = 1/[\sigma^2(F_o^2) + (0.0899P)^2]$ where $P = (F_o^2 + 2F_c^2)/3$
10643 reflections	$(\Delta/\sigma)_{\max} = 0.049$
618 parameters	$\Delta\rho_{\max} = 1.39 \text{ e \AA}^{-3}$
24 restraints	$\Delta\rho_{\min} = -1.02 \text{ e \AA}^{-3}$

Special details

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
